Quarterly Activities Report

For the period ended 30 June 2025

Highlights

- **Group copper equivalent production of 10.9kt[1] for the quarter at improved AISC of A$4.50/lb Cu eq**
- **Cash and receivables at end of quarter increased to $49.5M**
- **Refinancing of corporate guarantee facilities successfully completed**
- **Higher Tritton production of 6.2kt Cu at lower AISC of A$4.22/lb**
- **Tritton processing plant operating above nameplate capacity with the availability of additional ore from the Murrawombie Pit**
- **Strong Cracow gold production of 11.0koz and AISC of A$3,075/oz**
- **Good cost control across operations for the year**
- **North Queensland assets on care and maintenance – pursuing options for divestment**

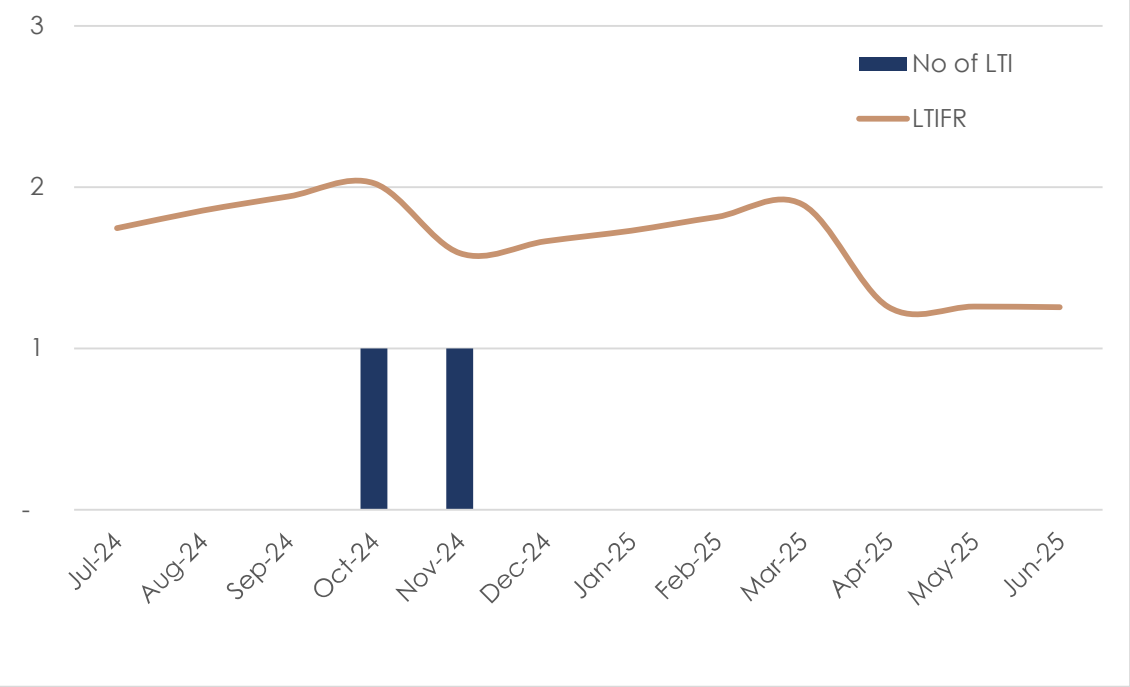
[1] Formula for Copper Equivalent (Cu eq) = ((Cu Produced x Cu $/t) + (Au Produced x Au $/oz) + (Ag Produced x Ag $/oz)) / (Cu $/t). Produced quantities are after recovery. Commodity prices – Sep quarter: US$9,210/t Cu, US$2,474/oz Au and US$29/oz Ag, Dec quarter: US$9,193/t Cu, US$2,663/oz Au and US$31/oz Ag, Mar quarter: US$9,345/t Cu, US$2,861/oz Au and US$32/oz Ag, Jun quarter: US$9,524/t Cu, US$3,281/oz Au and US$34/oz Ag

Group Safety, Environment and Community

Pleasingly, Aeris recorded no lost time injuries for the quarter with Group LTIFR reducing to 1.3 for the quarter.

There were no reportable environmental incidents during the quarter.

Figure 1: Group LTIFR



Tritton Operations (NSW)

Key points for quarter:

- Production of 6.2kt Cu (up 44%) at AISC of A$4.22/lb (down 31%)
- Processing plant operating above nameplate capacity (>2Mtpa) towards the end of the quarter
- Stockpiles of 77kt mined ore available for processing in FY26
- Capital costs lower than planned due to Stage 2 waste stripping in the pit being pushed into FY26

Production Summary	Unit	Sep 24 Qtr	Dec 24 Qtr	Mar 25 Qtr	Jun 25 Qtr	YTD	FY25 Guidance

1. Includes sustaining capital, capitalised mine development, rehabilitation and financing payments (principal and interest) on leased assets
2. All-In Sustaining and All-In Costs are based on copper produced. The March quarter has been amended for a for a calculation error.

Operations

Tritton achieved production of 6.2kt Cu in the June quarter, a 44% increase on the previous quarter. Underground production was higher quarter on quarter with additional stoping areas online. The mining improvement program continued to demonstrate better performance in key activities from that achieved in in the first half of the year:

- diamond drilling metres up 76%;
- development metres up 28%;
- backfill placement up 114%.

Total ore mined was boosted with the introduction of Stage 1 ore from the Murrawombie open pit, although the production ramp up was slower than expected. Since quarter end, Stage 1 mining completed, with the Stage 2 cut back progressing to plan.

At the end of the quarter, 77kt of mined ore was stockpiled, available for processing in FY26.

The processing plant performed well for the quarter, achieving new daily and weekly milling records towards the end of June when ore was available from the open pit. An annualised rate >2Mtpa was achieved in the final weeks of June, significantly above nameplate capacity of 1.8Mtpa. Metallurgical recoveries continued to be higher than plan

Figure 2: Stage 1 mining at Murrawombie Pit

At the Constellation project, mine planning work commenced on the updated Mineral Resource model to optimise open pit staging options, underground designs and production schedules. Technical work progressed on metallurgical test work, site layout and mine integration design. Aeris continues to work with the NSW DPHI Planning Authority, Mining Concierge, EPA, Resources Regulator, Heritage NSW and the Bogan Shire Council focussing on all aspects of the State Significant Development Consent (EIS).

Costs

Gross mining costs increased significantly with the ramp up in activities at Murrawombie Pit. All in sustaining costs however were lower on a unit basis due to higher copper tonnes produced. Operating and sustaining capital costs for the year were within guidance.

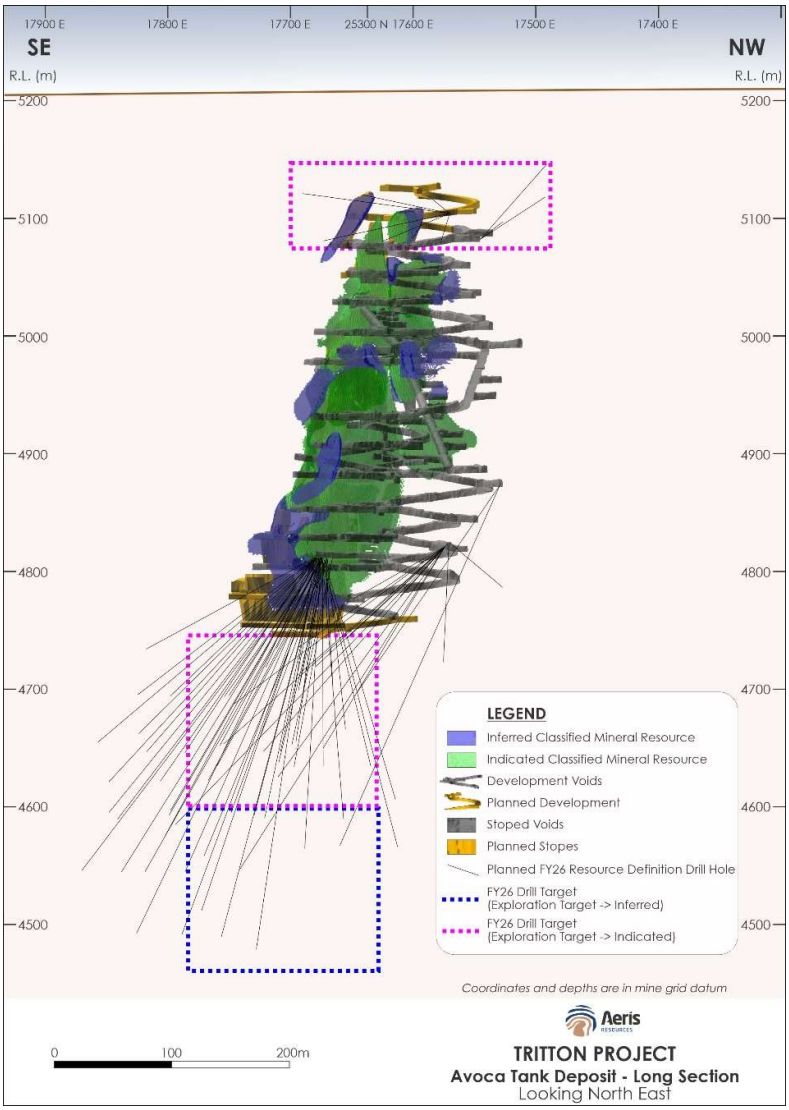
Growth capital for the quarter was lower than guidance due to capitalised stripping for Phase 2 of the pit being pushed into FY26.

Exploration

During the quarter, work progressed on refining the greenfield exploration strategy at Tritton. Regional geological interpretation continued, focused on understanding the key geological controls influencing mineral system formation — from the broader basin scale down to specific prospect areas. This work is expected to continue through the first half of FY26, with early-stage, on-ground exploration to follow, targeting the most prospective corridors identified through the review.

Underground resource definition drilling at the Avoca Tank deposit commenced during the quarter. The resource definition drill program is targeting mineralisation down plunge below the base of the current Mineral Resource.

Figure 3: Long section looking north east at the Avoca Tank deposit. Resource definition drilling is targeting extensions to mineralisation down-plunge from the known Mineral Resource (green and blue wireframes)



Cracow Operations (QLD)

Key points for quarter:

- Gold production 11.0koz (up 22%) at AISC of A$3,075/oz (down 12%)
- The secondary cyclone was commissioned in the quarter, with the processing plant demonstrating sustained improvement in recoveries from regrind mill debottlenecking
- TSF lift approved and contractor mobilised to construct in Q1 FY26

Production Summary	Unit	Sep 24 Qtr	Dec 24 Qtr	Mar 25 Qtr	Jun 25 Qtr	YTD	FY25 Guidance

1. Includes sustaining capital, capitalised mine development, rehabilitation and financing payments (principal and interest) on leased assets
2. All-In Sustaining and All-In Costs are based on gold sold

Operations

Cracow performed well in the June quarter with gold production of 11.0koz, 22% higher quarter on quarter due to improved mining rates and recoveries. Higher underground production offset lower grade stockpile material in the mill feed.

The newly installed secondary cyclone circuit at the plant is performing well enabling 100% of leach feed to now pass through the regrind mill. A sustained 1-2% improvement in metallurgical recovery has been achieved by debottlenecking the regrind mill.

The next lift on the tailings dam was approved by the regulator and the construction contractor has mobilised to site to commence construction in Q1 FY26.

Costs

AISC costs was well managed in the quarter, achieving a lower AISC/oz of A$3,075, driven by higher gold production. Costs for the year were well controlled with capital and operating costs broadly within guidance ranges.

Exploration

A review is underway to assess the remaining gold prospectivity within the Golden Plateau mine footprint. Previous drill programs completed by Aeris at Golden Plateau focused on targeting structures south of the historical workings (Chas, King and Harry's lode) and a shallow lode on the western margin of the deposit (Western lode). The primary focus of the drill programs was to delineate discrete high-grade structures for extraction via underground mining methods.

The current review focuses on understanding the potential for a broader, low-grade gold system that could support a larger-scale open-pit mining operation.

The Golden Plateau deposit is the most significant contributor to the known Cracow goldfield in terms of ounces, with approximately 850koz produced to date. Mining (underground) began in the early 1930s and continued until 1976. Production over this period totalled approximately 1.55Mt at 11.9g/t[1] Au for 596koz Au, over eight levels to a maximum depth of 260m below surface.

Following a short hiatus, open pit mining commenced in 1987 and continued through to 1990[1], targeting lower-grade mineralisation surrounding the previously mined high-grade shoots. The pit advanced to approximately 120m below surface and mined through the upper three underground levels, producing 2.2Mt at 2.7g/t Au for 190koz Au[1]. Toward the end of the open pit operation, a brief phase of underground mining occurred along the NS12 structure located on the northeast portion of the deposit. Reported production was 46kt at 9.4g/t Au for 14koz Au.

While the review is in its early stages, initial assessment of in-pit grade control data has identified extensive low-grade (+1g/t Au) mineralisation that was left behind by underground mining. This low-grade mineralised halo appears continuous in places and is supported by historical drilling below the pit, which intersected similar low-grade gold zones. Mining records also show that underground stoping continued below the current pit floor, further highlighting the potential for continuity of mineralisation at depth.

North Queensland Operations (QLD)

Key points for quarter:

- Operations on care and maintenance
- Options for divestment of North Queensland assets are being pursued

Production Summary	Unit	Sep 24 Qtr	Dec 24 Qtr	Mar 25 Qtr	Jun 25 Qtr	YTD	FY25 Guidance

1. Includes sustaining capital, capitalised mine development, rehabilitation and financing payments (principal and interest) on leased assets
2. All-In Sustaining and All-In Costs are based on copper produced

Operations

The North Queensland operations remain on care and maintenance. No material work was undertaken on the site this quarter. The company continues to investigate options for a divestment of the assets.

Jaguar Operations (WA)

Key points for quarter:

- Operation in care and maintenance, incurring costs of $3.0 million
- Advanced the feasibility study, with particular focus on mine development and production schedules to optimise project value
- Renewed focus on greenfield exploration

Exploration

During the quarter exploration focussed on drilling at the Holey Moley gold prospect (E37/981) with base metal exploration continuing to advance drill targets along the known prospective 10km volcanic-hosted massive sulphide (VHMS) corridor.

Drilling at the Holey Moley gold prospect included a three-hole RC drilling program. The prospect is located along a WNW trending structure interpreted to merge into the more regionally significant NNW trending Heather Bore shear, which hosts a well-defined 2km shallow gold anomaly[1]. Additional pathfinder anomalism, including bismuth and tellurium, are coincident with this gold zone. The WNW structure targeted in this round of drilling lies within a broader series of parallel features interpreted from geophysical datasets, which appear to intersect the Great Western and Celtic deposits outside Aeris tenements to the west. The current working assumption is that these structures form high-angle features to the Heather Bore shear, which may transmit and focus gold mineralisation.

Due to operational constraints, the drill holes were terminated before reaching their planned hole depths and may not have fully tested the target structure. However, assay results from the program confirmed low-grade, discontinuous gold mineralisation, with best results including 1m @ 1.48 g/t Au in hole 25HMRC002A (refer to Figure 5 and Figure 6). These drill intercepts occur at similar relative elevations to nearby historical intersections and appear consistent with a supergene or transition-zone style of mineralisation.

While results were sub-economic, the program has refined the geological model and confirmed mineralisation continuity across a key structural trend. Follow-up drilling is warranted to further assess the potential for primary gold mineralisation along the WNW trending structure.

[1] Refer to ASX announcement "Exploration and resource drilling update" dated 17 June 2024

Figure 5: Heather Bore and Holey Moley gold prospects within the northern margin of the Jaguar Project tenement. Regional geology is shown with maximum down-hole gold grades displayed across historical[1] (aircore/RC) and more recent Aeris drill programs[2]

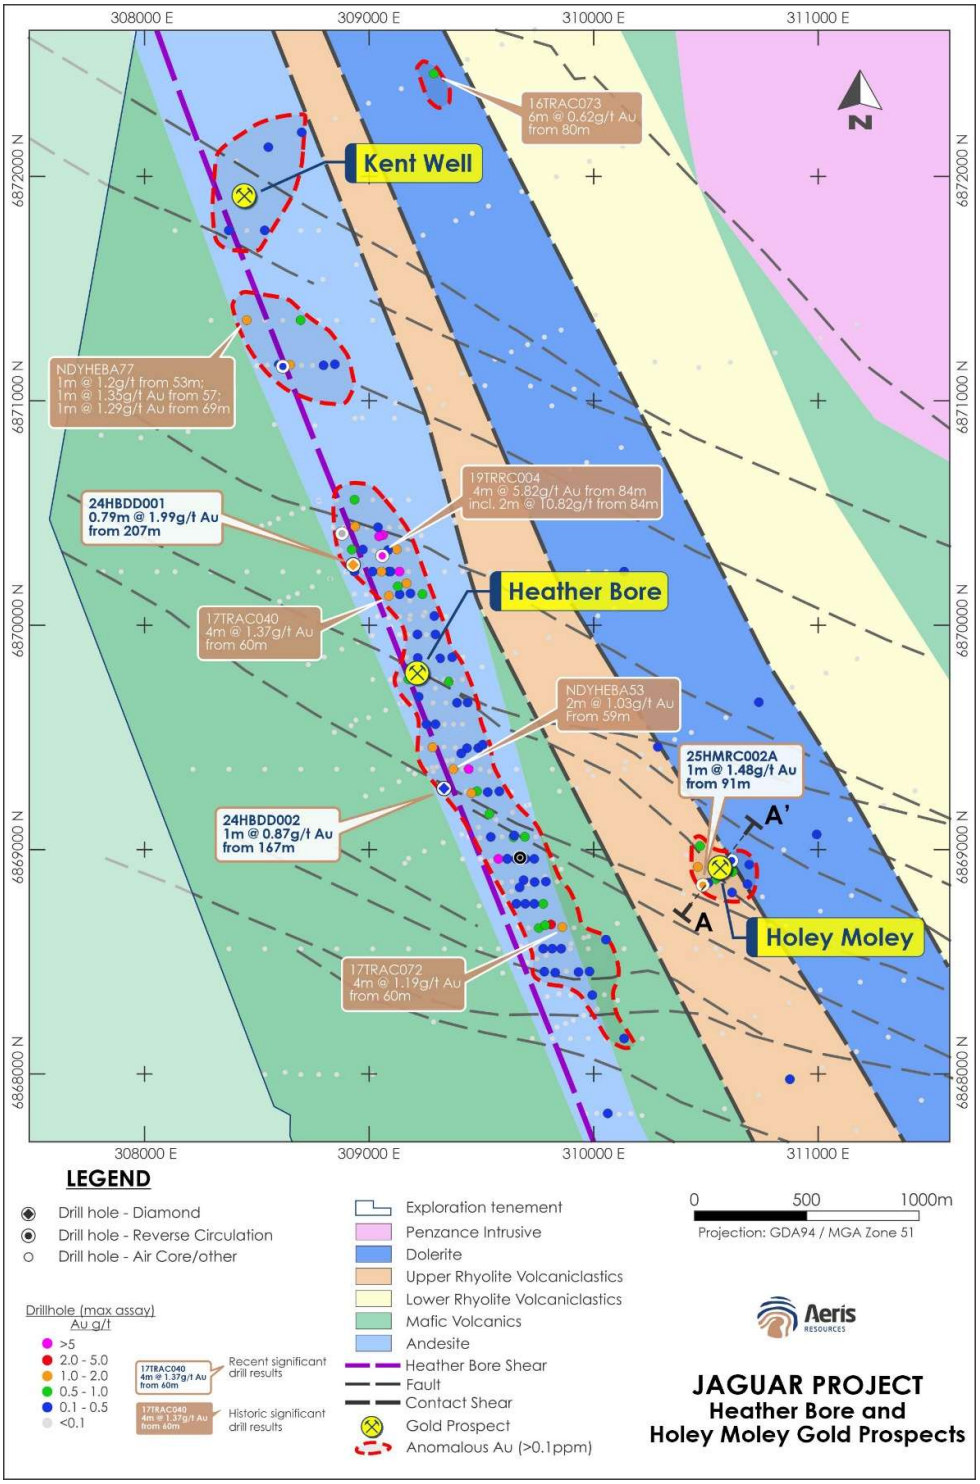

Figure 6: Cross section view looking north-west at the Holey Moley gold prospect showing downhole gold assays from the 2025 drill program and historical programs completed by previous explorers[1]

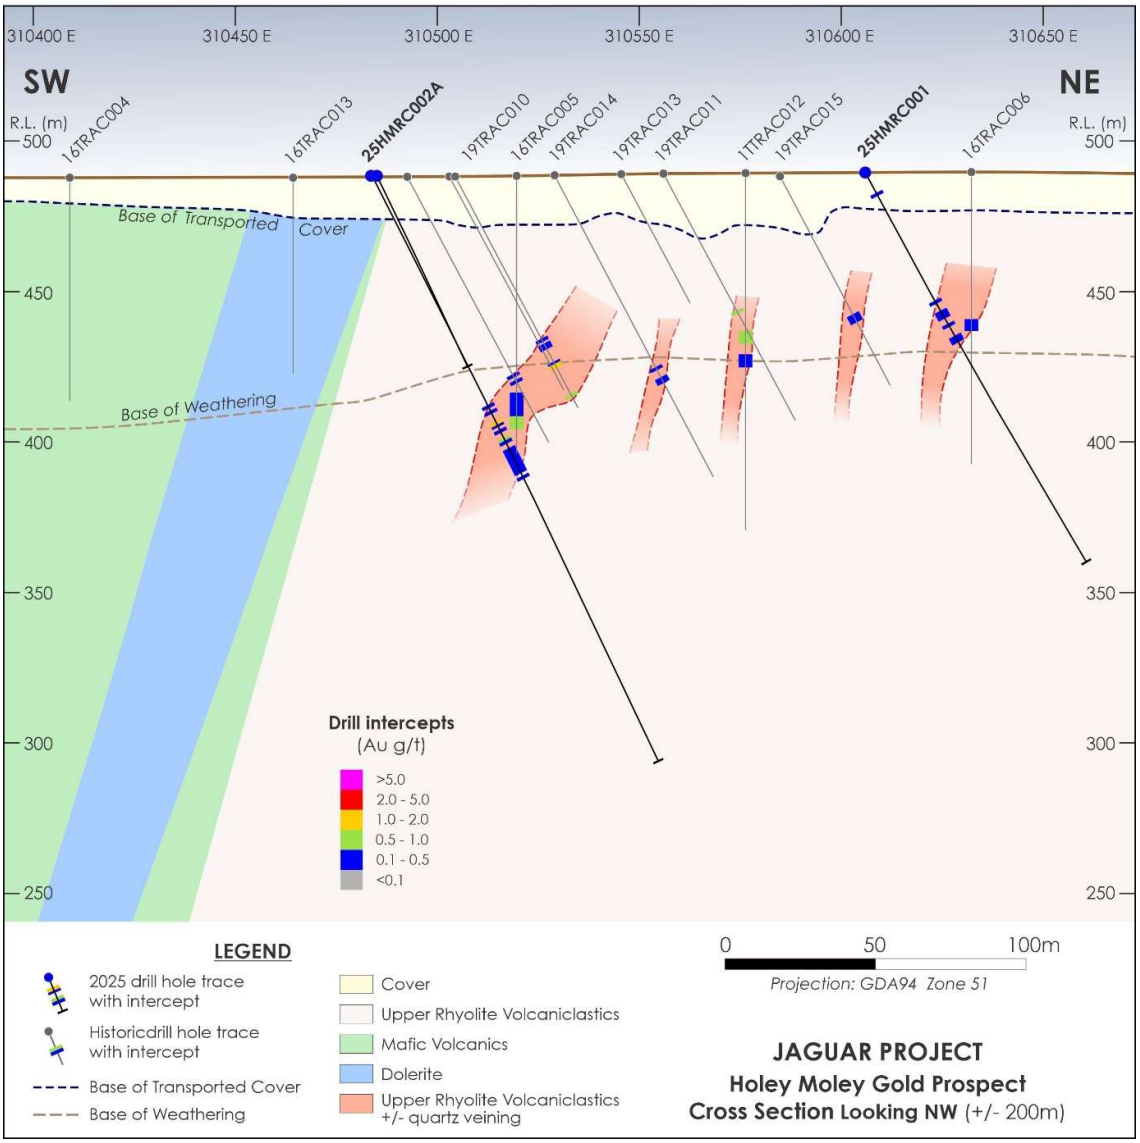
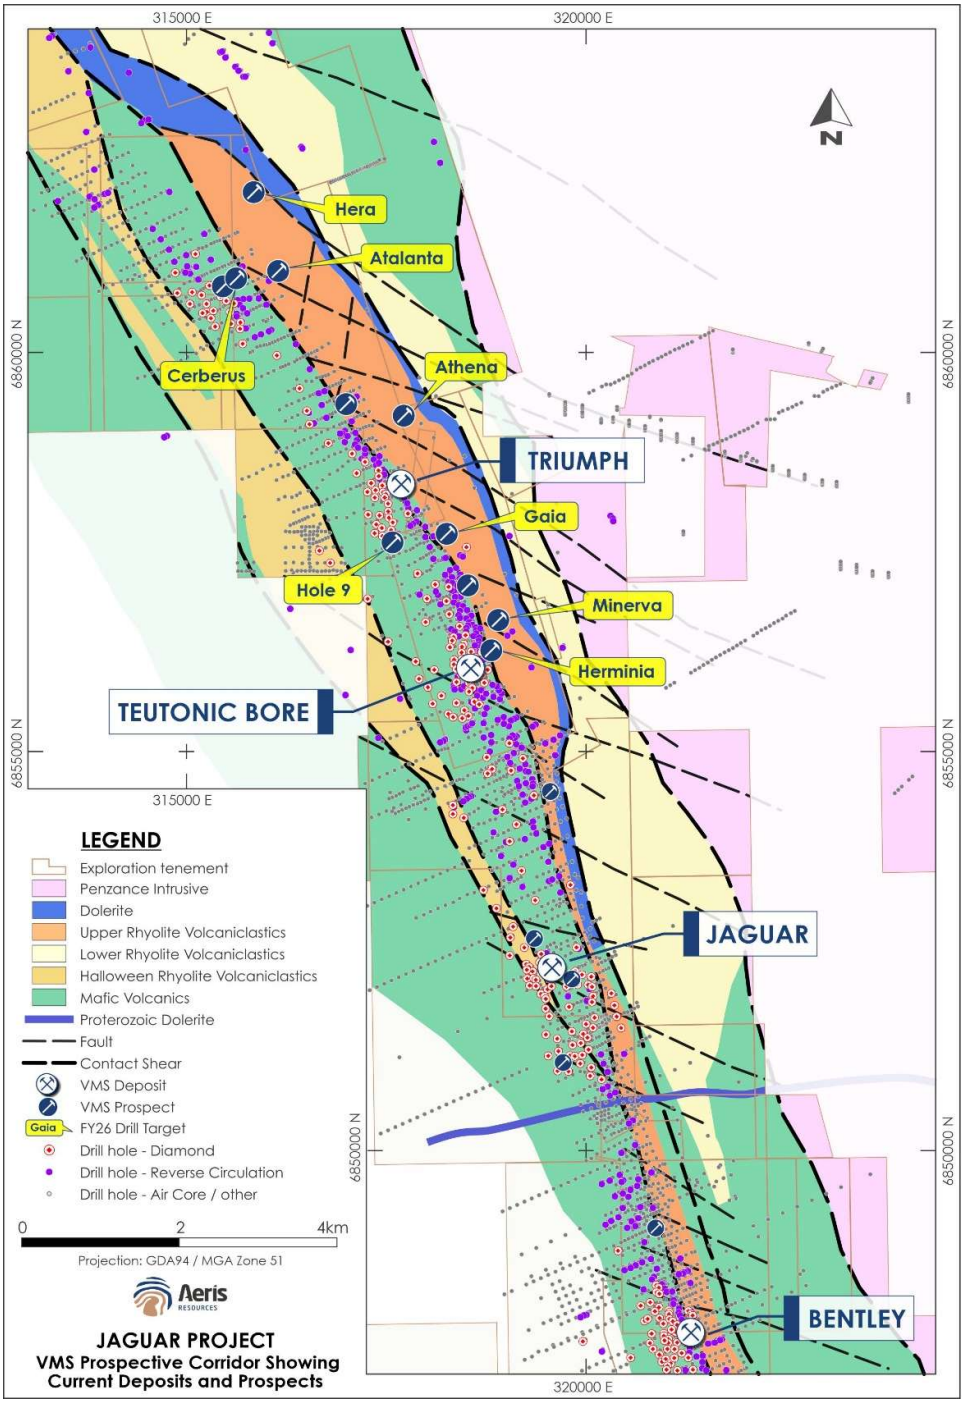


The base metal exploration drill target review defined eight high-priority drill-ready targets (refer to Figure 7). A first pass drill program is planned to test each target in FY26.

[1] Refer to ASX announcement "Exploration and resource drilling update" dated 17th June 2024
[2] Refer to ASX announcement "Quarterly Activities Report – Sept 2024" dated 30th October 2024
[1] Refer to ASX announcement "Exploration and resource drilling update" dated 17 June 2024

Figure 7: Regional geology across the known VHMS corridor showing the location of the four known VMS deposits (Triumph, Teutonic Bore, Jaguar and Bentley) and the eight priority drill targets that will be tested in FY26



Target generation was informed by a regional mapping campaign that reclassified stratigraphy immediately east of the known prospective VHMS corridor. An extensive sericite-altered untested rhyolitic volcaniclastic sequence, up to 1km thick, had previously been misinterpreted as massive rhyolite and largely overlooked by earlier explorers. While the presence of this unit alone does not confirm prospectivity, it becomes of greater interest when considered in conjunction with other datasets.

Discrete gravity anomalies identified in Aeris' 2022 infill gravity survey, low-level pathfinder anomalism returned from ongoing rock chip sampling, and the presence of pervasive sericite alteration collectively support a compelling case for VHMS-style mineralisation within this newly defined corridor.

The discrete gravity anomalies, are modelled with amplitudes ranging from 0.8 to 1.8 milligals, interpreted depths between 60m and 200m, and strike lengths between ~ 300m and 1km. The gravity bodies coincide with subdued magnetic responses, suggesting they are unlikely to be associated with magnetic dolerite sills that are common throughout the stratigraphic profile at Jaguar. However, it does not discount the possibility that the gravity bodies could be associated with nonmagnetic mafic bodies.

Although surface geochemical coverage remains limited, a rock chip sampling program is underway across the eight priority targets. Preliminary results, which are still being evaluated, have returned low-level anomalies in multiple pathfinder elements, such as Ag, As, Bi, In, Pb, Sb, Sn, and Tl, further supporting the potential for VHMS-style mineralisation.

Stockman Project (VIC)

Key points for quarter:

- Detailed Albion leach metallurgical test work completed with remaining test work due in Q1 FY26
- Preliminary design of Albion and alternate pyrite-based flowsheet to incorporate sulphuric acid generation due for completion in Q1 FY26
- Site visits to locations for proposed downstream processing facility completed, with associated permitting requirements being assessed

Corporate

Cash and Receivables

At the end of the quarter, Aeris increased useable cash and receivables to $49.5 million with a closing unrestricted cash balance of $28.2 million. Approximately ~$10 million was released to cash during the quarter under the refinanced facilities (see below for more information). Total restricted cash held against bonds reduced to $17 million.

(A$ Million)	Sep 24 QTR	Dec 24 QTR	Mar 25 QTR	Jun 25 QTR
Closing Cash	25.5	26.4	22.4	28.2
Receivables				
Mt Colin	3.6	0.3	-	-
Cracow	-	0.1	-	-
Tritton	10.0	6.2	11.2	21.3
Useable Cash and Receivables	**39.1**	**33.0**	**33.6**	**49.5**

Cash flow from operations at $34 million was lower than previous quarter due to timing of receipts. Receivable were considerably higher at $21.3 million; a significant portion was received in July 2025.

(A$ Million)	Sep 24 QTR	Dec 24 QTR	Mar 25 QTR	Jun 25 QTR
Opening cash	24.8	25.5	26.4	22.4

Closing cash	25.5	26.4	22.4	28.2

Figure 8: June Quarter Cash Flow (A$M)

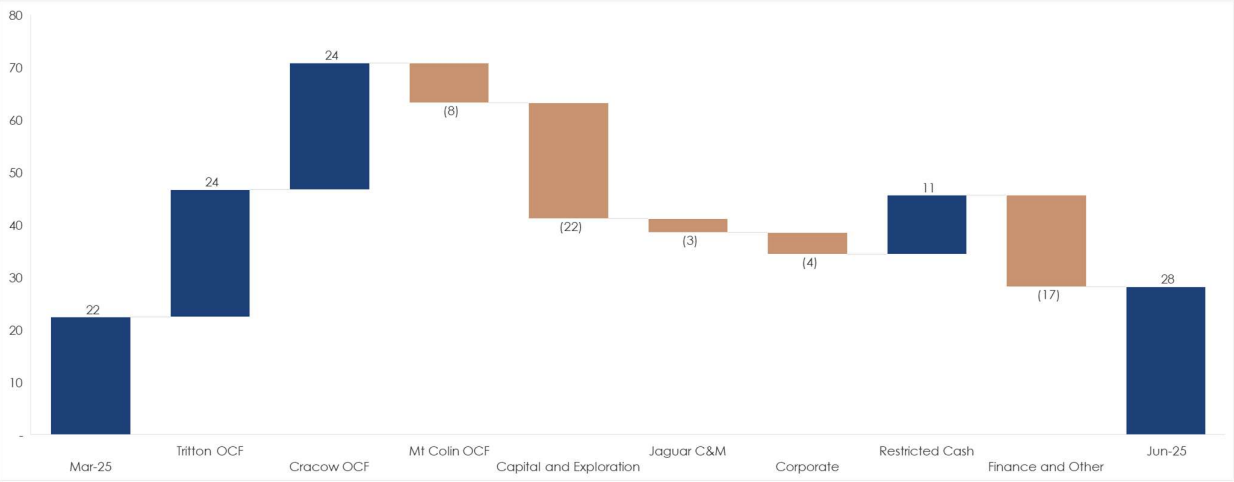

Figure 9: YTD Cash Flow (A$M)

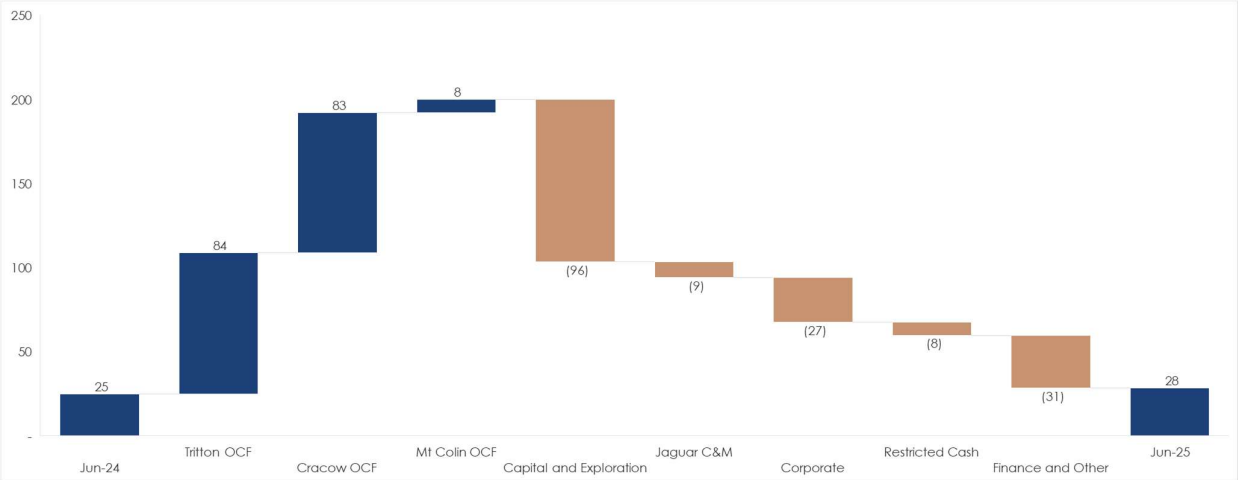

Debt and Hedging

During the quarter the company completed the refinancing of its $50 million guarantee facility with ANZ with a new $60 million guarantee facility from Washington H. Soul Pattinson (WHSP). The facility agreement also extended the term on the $50 million loan facility (drawn to $40 million) with WHSP to 31 August 2026. The Company had no hedges in place at the end of the quarter.

About Aeris

Aeris Resources is a mid-tier base and precious metals producer. Its copper dominant portfolio comprises two operating assets, a mine on care and maintenance, a long-life development project and a highly prospective exploration portfolio.

Aeris has a strong pipeline of organic growth projects, an aggressive exploration program and continues to investigate strategic merger and acquisition opportunities. The Company's experienced board and management team bring significant corporate and technical expertise to a lean operating model. Aeris is committed to building strong partnerships with its key community, investment and workforce stakeholders.

Competent Persons Statement

Mr Chris Raymond confirms that he is the Competent Person for all Exploration Results at the Tritton Operation, and he has read and understood the requirements of the 2012 Edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves (JORC Code, 2012 Edition). Mr Raymond is a Competent Person as defined by the JORC Code, 2012 Edition, having relevant experience to the style of mineralisation and type of deposit described in the Report and to the activity for which he is accepting responsibility. Mr Raymond is a Member of the Australian Institute of Geoscientists (MAIG No. 6045). Mr Raymond has reviewed the Report to which this Consent Statement applies and consents to the inclusion in the Report of the matters based on his information in the form and context in which it appears. Mr Raymond is a full-time employee of Aeris Resources Limited.

The information in this report that relates to Exploration Targets or Exploration Results at the Cracow Operation is based on information compiled by Craig Judson. Mr Judson confirms that he is the Competent Person for all Exploration Results, summarised in this Report and he has read and understood the requirements of the 2012 Edition of the Australasian Code for Reporting of Exploration Targets, Exploration Results, Mineral Resources and Ore Reserves (JORC Code, 2012 Edition). Mr Judson is a Competent Person as defined by the JORC Code, 2012 Edition, having relevant experience to the style of mineralisation and type of deposit described in the Report and to the activity for which he is accepting responsibility. Mr Judson is a Member of the Australasian Institute of Mining and Metallurgy (MAusIMM No. 325510). Mr Judson has reviewed the Report to which this Consent Statement applies and consents to the inclusion in the Report of the matters based on his information in the form and context in which it appears. Mr Judson is a full-time employee of Aeris Resources Limited.

The information in this report that relates to Exploration Targets or Exploration Results at the Jaguar Operation is based on information compiled by Alain Cotnoir. Mr Cotnoir confirms that he is the Competent Person for all Exploration Results, summarised in this Report and he has read and understood the requirements of the 2012 Edition of the Australasian Code for Reporting of Exploration Targets, Exploration Results, Mineral Resources and Ore Reserves (JORC Code, 2012 Edition). Mr Cotnoir is a Competent Person as defined by the JORC Code, 2012 Edition, having relevant experience to the style of mineralisation and type of deposit described in the Report and to the activity for which he is accepting responsibility. Mr Cotnoir is a Member of the Australasian Institute of Mining and Metallurgy (MAusIMM No. 315017). Mr Cotnoir has reviewed the Report to which this Consent Statement applies and consents to the inclusion in the Report of the matters based on his information in the form and context in which it appears. Mr Cotnoir is a full-time employee of Aeris Resources Limited.

APPENDIX A: Summary of Golden Plateau drill hole collar, survey details and significant intersections for holes not previously reported.

[1] Reported significant intervals are based on a minimum width of 1m, minimum Au grade 0.1g/t Au and a maximum of 2m (consecutive samples) of below cut-off material (<0.1g/t Au).

APPENDIX D

JORC Code, 2012 Edition – Table 1

Section 1 Sampling Techniques and Data

Golden Plateau pre 2020 drill programs

Criteria	Commentary
Sampling techniques	1. Numerous drillhole sample types were collected at Golden Plateau historically (1932 onwards) from a variety of sampling techniques. Given the duration of time over which data has been collected, it's necessary to categorise by company and time. The following table will refer to the categories as: o 1932 to 1976 - G.P.N.L. **Prefixes: DDH, F, GP, NE, NS, PH** 1979 to 1995 - Sedimentary Uranium\Sedimentary Holdings **Prefixes: AT, ATF, CDH, CGW, CRC, CRCF, CUD, E, FO, FSD, FSR, GPE, GPF, GPR, GTA, GTR, OXY, W, WDS, WHD, WHO WHR, WHT** o 1995 to 2011 - Newcrest (70% of Cracow Joint Venture) **Prefixes: CGP, KDD, KRC, Z** o 2011 to 2019 - Evolution Mining **Prefixes: GPS** o 2019 to Date - Aeris Resources **Prefixes: GPE, GPS** 2. Across all categories, sampling was completed on diamond drill (DD) core and reverse circulation (RC) drill cuttings. There is a smaller number of percussion and air track holes; hole prefixes PH and AT respectively. 3. There are limited descriptive sample protocols for pre 1995 drillholes; mostly, sampling was done for Au only and, only parts of the core with visual grade indicators (vein %) were taken. Most of the DDH series only had composited grades available. Post 1995 drillholes, sample intervals from drill core were determined by visual logging. RC samples were collected on 1m intervals. From 1995 to 2020, there is hard copy documentation available of sampling procedure. Some of that information has been reviewed. 4. Aeris drilling from 2020 consists of standard 1m RC rig split 3kg samples and diamond with half HQ3 core or whole NQ2 core sampling on 0.4 to 1.2m intervals targeting 1m sample lengths but adapted for geology. Sample preparation was undertaken at ALS laboratories.
Drilling techniques	1. A combination of drilling techniques was used across the Golden Plateau deposit. Post 1995, drill holes RC (face sampling bit), diamond HQ/NQ (triple tube and standard) and LTK60 were the most used. A small number of the HQ and NQ holes were orientated. Pre 1995 holes have diamond drill core sizes ranging from AX to NQ. 2. Aeris drilling includes RC drilling that was completed using a 5½ inch diameter drill bit or HQ3 pre-collars and NQ2 tails. Most mineralised intervals were NQ2 diameter.
Drill sample recovery	1. Aeris RC sample recoveries were visually observed based on sample return and averaged >90%. "Dry", "Damp" and "Wet" codes were recorded for each interval. Aeris diamond drill core was reconstructed and orientated where possible. 2. Pre 1995 data do not detail measures taken to maximise recovery although drillhole recovery is demonstrated and recorded in available logs.

Criteria	Commentary
	3. The relationship between grade and recovery has not yet been reviewed for holes listed in Appendix A.
Logging	1. Pre 1980 drill holes only a handful of complete logs exist. Post 1980 and pre 2009 logs are a mix of digital and hardcopy logs. They can be sourced for most holes. Post 2009 Maxwell Geo Products (Datashed and LogChief) has been used to log and store information. 2. Pre 1995 logging that has been viewed it seems qualitative. Post 1995 logging is mostly qualitative. 3. Generally, logging is most detailed around sampled intervals for both historical and recent data.
Sub-sampling techniques and sample preparation	1. Since July 2020, HQ3 core was halved for sampling and NQ2 core was whole core sampled. Before Aeris ownership, diamond core sub sampling techniques need to be reviewed from hard copy and digital sources. 2. Aeris RC drilling followed conventional industry standards and used ~5 inch face sampling hammers with an onboard cyclone and a '1-in-8' riffle splitter to achieve a target sample of ~3kg. Before Aeris ownership, RC sub sampling techniques have not been reviewed. 3. Prior to the Datashed Database in 2009 preparation and handling techniques may exist but have not yet been sighted in the document facility. Aeris core and RC samples were pulverised for 10-14 minutes in a LM5 bowl with a target of 85% passing 75µm. 4. Lab duplicates were performed on Aeris batches and processed by ALS every 20 samples at both the crushing and pulverising stages. This sample preparation for drill samples is considered appropriate for the style of mineralisation at Cracow. Documentation of previous practices has not been reviewed. 5. For drill programs between 1995 and 2020 the frequency and method of duplicate sample protocols has not been reviewed. 6. For post 1995 drillholes, the sample size collected is appropriate for the style of gold mineralisation being sampled.
Quality of assay data and laboratory tests	1. For pre 1995 drill holes the assay method is not mentioned but may exist as hard copies in a document facility onsite. From 1995 to 2020, the samples were analysed by 50g fire assay for Au with atomic absorption (AAS) finish at a certified laboratory. 2. Pre-Aeris, lab qc protocols and company QC protocols need to be reviewed. For Aeris, an analytical duplicate was performed every 20 samples, aligned in sequence with the crushing and pulverising duplicates. Aeris certified standards, at a suitable range of gold grades, were inserted at a minimum rate of 1:20 with each sample submission. The current insertion of CRMs, duplicates, and blanks is at a rate of 5%, 5% and 3% respectively.
Verification of sampling and assaying	1. It is unknown what verification of significant intersections has occurred by independent or alternative company personnel. 2. Drilling of twin holes on historical drillholes has not been enacted yet. 3. Since 2009 sample information is stored in a Datashed Database. The software contains several features to ensure data integrity. These include (but are not limited to): o Not allowing overlapping sample intervals. o Restrictions on entered data to certain fields. o Restrictions on what actions can be performed in the database based on the individual user.

Criteria	Commentary
	4. Data entry to Datashed was undertaken through a combination of site-specific electronic data-entry sheets, synchronisation from Logchief and upload of .csv files. 5. For post 1980, no adjustments are made to the finalised assay data received from the laboratory. Most Au assay data pre-1980 had to be converted from penny weight to g/t.
Location of data points	1. Pre 1980 hole collar information was sourced from available logs and the department of Queensland. Pre 1980 underground diamond holes are likely to only have a survey taken at the collar point. 2. From 1980 onwards, the position of surface holes was determined by differential GPS or handheld GPS. 3. From 1980 to 1995 most down hole survey readings were captured by an Eastman camera. From 1995 onwards mostly a Reflex camera has been used for downhole surveys. All Aeris drilling was surveyed by independent contractors on 30m intervals. 4. Older mine grid transformations are well understood and documented by the site survey team. The two point transformation between the local mine grid for Golden Plateau and the projected grid MGA2020 Zone 56 are summarised below: Golden Plateau **North** **East** Pt 1 2,072.46 1,719.87 Pt 2 2,062.06 2,468.88 MGA2020 Zone 56 Pt 1 7,200,795.822 227,135.139 Pt 2 7,200,693.853 227,877.501 5. The topographic wireframe was generated by the survey department from Airborne Laser Scan and ground surveying methods. The topographic wireframe for historical Golden Plateau modelling is available.
Data spacing and distribution	1. Sample spacing varies considerably given the variety of drill campaigns over the years, and restricted surface drill site locations. The data density varies from <10m x <10m to >80m x >80m. 2. Spacing is varied per campaign and drill type 3. No sample compositing has been applied. However, for some historical drill holes, sample intervals span several metres, which in effect is an indirect form of compositing.
Orientation of data in relation to geological structure	1. Pre 2020 drill programs: sample biases of the core have not been reviewed. 2. Pre 2020 drill programs: sample biases from drilling orientation against grade bearing structures have not been reviewed. 3. Aeris drill programs (2020 onwards): Drill holes are orientated to target the mineralised structures at a high angle to minimise sample bias. In some instances that protocol can be difficult to maintain with limited

Criteria	Commentary
	drill locations on surface. The intersection angles/orientations from the Aeris drill campaigns are considered representative and are not biased.
Sample security	1. Sample security protocol prior to Aeris ownership has not been reviewed.
Audits or reviews	1. No formal external audits of Golden Plateau during Aeris's ownership have been conducted.

JORC Code, 2012 Edition – Table 1

Section 2 Reporting of Exploration Results

Golden Plateau pre 2020 drill programs

Criteria	Commentary
Mineral tenement and land tenure status	1. The Cracow Operation is located immediately west of the Cracow township in central Queensland. The Cracow Operation Exploration and Mining Tenement package comprises three EPMs and 18 MLs covered a combined area of approximately 889km^2. 2. The Cracow Operation Exploration and Mining tenements are wholly owned by Aeris Resource's wholly owned subsidiary, Lion Mining Pty Ltd. 3. The Golden Plateau deposit is located within ML3227. ML3227 is in good standing and no known impediments exist.
Exploration done by other parties	1. The Cracow Goldfields were discovered in 1932, with the identification of mineralisation at Dawn, then at Golden Plateau in the eastern portion of the field. From 1932 to 1992, mining of Golden Plateau and the associated trends produced approximately 850koz of Au metal. Exploration across the fields and nearby regions was completed by several entities including BP Minerals Australia, Australian Gold Resources Ltd, ACM Operations Pty Ltd, Sedimentary Holdings NL and Zapopan NL. 2. In 1995, Newcrest Mining Ltd (NML) entered into a 70% share of the Cracow Joint Venture. Initially, exploration was targeting porphyry-type mineralisation, focusing on the large areas of alteration at Fernyside and Myles Corridor. This focus shifted to epithermal exploration of the western portion of the field, after the discovery of the Vera mineralisation at Pajingo, which shared similarities with Cracow. The Royal epithermal mineralisation was discovered in 1998, with further discoveries of Crown, Sovereign, Empire, Phoenix, Kilkenny and Tipperary made from 1998 up to 2008. 3. Evolution was formed from the divestment of Newcrest assets (including Cracow) and the merging of Conquest and Catalpa in 2012. Evolution continued exploration at Cracow from 2012 to early 2020. 4. Aeris Resources purchased the Cracow Operation (including the exploration and mining tenements) in July 2020.
Geology	1. The Cracow area gold deposits are in the Lower Permian Camboon Andesite on the south-eastern flank of the Bowen Basin. The regional strike is north north-west and the dip 20° west south-west. The Camboon Andesite consists of andesitic and basaltic lava, with agglomerate, tuff and some inter-bedded trachytic volcanics. The

Criteria	Commentary
	andesitic lavas are typically porphyritic, with phenocrysts of plagioclase feldspar (oligoclase or andesine) and less commonly augite. To the west, the Camboon Andesite is overlain with an interpreted disconformity by fossiliferous limestone of the Buffel Formation. It is unconformably underlain to the east by the Torsdale Beds, which consist of rhyolitic and dacitic lavas and pyroclastics with inter-bedded trachytic and andesitic volcanics, sandstone, siltstone, and conglomerate. 2. Mineralisation is hosted in steeply dipping, low-sulphidation epithermal veins. These veins occur as discrete and as stockworks and are composed of quartz, carbonate and adularia, with varying percentages of each mineral. Vein textures include banding (colloform, crustiform, cockade, moss), breccia channels and massive quartz, and indicate depth within the epithermal system. Sulphide percentage in the veins are generally low (<3%) primarily composed of pyrite, with minor occurrences of hessite, sphalerite and galena. Rare chalcopyrite, arsenopyrite and bornite can also be observed. 3. Alteration of the country rock can be extensive and zone outwards from the central veined structure. This alteration consists of silicification, phyllic alteration (silica, sericite and other clay minerals) and argillic alteration in the inner zone, grading outwards to potassic (adularia) then an outer propylitic zone. Gold is very fined grained and found predominantly as electrum but less commonly within clots of pyrite.
Drillhole information	1. A list of drillholes at the Golden Plateau deposit, that not have not been included in previous Aeris announcement (refer to ASX announcement maiden Mineral Resource for Golden Plateau" 25 January 2023, are included in Appendix A.
Data aggregation methods	1. Summary intervals provided in Appendix A have a grade of >0.5g/t with a maximum of 3m internal dilution and minimum width of 1m.
Relationship between mineralisation widths and intercept lengths	1. The mineralised shoots are generally interpreted to sub vertical. There are descriptions of sub-horizontal mineralised veins (flat makes) within sections of the known mineralised system. Based on research completed to date, there flat makes would represent a small proportion of ounces mined. 2. A combination of surface and underground drill holes have been completed at Golden Plateau. Where possible drill holes have been designed to hit the mineralised structures/veins at right angles, however there are a large number of drill holes that intersect the mineralised structures/veins at acute angles.
Diagrams	1. Refer to the body of the report for diagrams
Balanced reporting	1. The reporting is considered balanced, and all material information associated with the drill results has been disclosed.
Other substantive exploration data	1. There is no other relevant substantive exploration data to report.
Further work	1. There is work being done to update the geological interpretation and geology model

APPENDIX E

JORC Code, 2012 Edition – Table 1

Section 1: Sampling Techniques and Data

The information presented supports the following activities: 1) Holey Moley 2025 RC drill program, 2) gravity survey and 3) rock chip sampling

Criteria	Commentary
Sampling techniques	***Reverse Circulation (RC)*** 1. Samples were collected by a cyclone splitter at the drill rig for each meter drilled as the sample was produced. 2. Samples were inspected by the site geologist for appropriate size, and moisture content noted. Sample weights are reported by the laboratory. 3. A nominal 2-3.5kg sample was produced from the cyclone splitter for assay, captured in a sequenced calico bag. 4. A nominal 25g was split by the laboratory for the Fire Assay analysis. The procedure is appropriate for this type of sample and analysis. 5. Samples were pulverised to produce a 25 g charge for fire assay, and AAS finish. Detection limit of 0.005g/t Au – 100g/t Au. 6. The sample size and sample preparation techniques are considered appropriate for the style of mineralisation. 7. Industry prepared standards are inserted approximately 1 in 25 samples. 8. The samples are considered representative and appropriate for this type of drilling. ***VMS Exploration*** 1. No historical or new VMS exploration results are reported in this release. Only collar locations on figures accompanying this release are reported. ***Rock Chip Samples*** 1. During field reconnaissance within Jaguar Tenements north of the Teutonic Bore open pit, rock grab samples were collected from various outcrops with samples recovered using a geo-pick. 2. Rock samples typically comprised multiple small chips within about 1m of the recorded sample point, selected for 48 element analysis. 3. No certified reference material (CRM) or blank QAQC samples were inserted with the sample batches as it typically included less than 25 primary samples. No field duplicates were taken. 4. The independent laboratory (Intertek-Genalysis) was used for the rock sample analysis and performed its own internal checks including insertion of pulp duplicates, CRM and repeat samples as required. 5. The sample mass was approximately 500g to 1.5 kg and samples were placed in clean calico bags. 6. Sample preparation & assaying was conducted by Intertek-Genalysis, a recognised, ISO-certified, and independent assay

Criteria	Commentary
	laboratory. Samples were crushed in a Boyd Crusher and pulverised with at least 85% passing -75µm at the laboratory. The samples were subjected to a four acid digestion digest and processed as a 25g charge with an ICP-MS (code4A/MS48) for a suite of 48 multi-elements (detection limits varying from 0.01 to 100 ppm depending of elements). ***Geophysics*** 1. An infill gravity survey was completed at the Jaguar Mine Site by Daishsat Geodetic Surveyors between November 2022 and February 2023. 2. Scintrex CG - 5 Autograv Gravity Metres were used. 3. Location data was acquired via a Leica GX1230 GNSS receivers with accuracy of +/- 5mm recorded. 4. 35,764 gravity stations collected on a nominal 50 metres spacing separated by 50, 100m and 200m spaced east-west trending Lines.
Drilling techniques	***Reverse Circulation (RC)*** 1. Drill holes completed via percussive reverse-circulation drilling contain the 'RC' code in their name. Samples were drilled with hammer face sampling bit, nominal 5.6-inch diameter. ***VMS Exploration*** 1. No historical or new VMS exploration results are reported in this release. Only collar locations on figures accompanying this release are reported.
Drill sample recovery	***Reverse Circulation*** 1. Sample systems are cleaned between holes to minimise contamination. Air is used to flush sample systems between rod changes or at discretion of the logging geologist. 2. Sample moisture is recorded and attributed to each sample meter. The effect of moisture on sample integrity has been investigated for this program and found to have had no material effect on grade. ***VMS Exploration*** 1. No historical or new VMS exploration results are reported in this release. Only collar locations on figures accompanying this release are reported.
Logging	***Reverse Circulation (RC)*** 1. All RC chips are geologically logged by Aeris geologists, using an appropriate geology logging template which records lithology, mineralogy, mineralisation, alteration and weathering. 2. A representative sample of rock chips are taken from the bulk sample, then wash and catalogued in a chip tray with each cell corresponding to one meter. Each cell and tray is labelled corresponding to the meter and hole ID. 3. All holes were logged in full.

Criteria	Commentary
	VMS Exploration 1. No historical or new VMS exploration results are reported in this release. Only collar locations on figures accompanying this release are reported. ***Rock Chip Samples*** 1. Geological data for rock chip samples was logged according to the Jaguar Mine Site geology Legend which conforms to industry best practice procedures. This includes logging weathering, lithology, alteration, mineralisation, veining and structural features. Where required the logging recorded the abundance of minerals or the intensity of alteration using defined ranges. 2. Logging is primarily qualitative in nature and is closely governed by Jaguar Mine Site standard geological protocols and procedures. 3. No photographs have been taken of the rock chip samples. 4. For each rock samples, weathering, lithology, alteration, mineralisation, veining, structural features, and abundance of minerals or the intensity of alteration is noted and recorded in the database.
Sub-sampling techniques and sample preparation	***Reverse Circulation (RC)*** 1. RC chips are sub-sampled using industry standard cyclone splitter, at the rig per meter drilled. 2. The splitter produces a 2-3.5kg sample captured to a calico which is submitted in full to the laboratory. ***VMS Exploration*** 1. No historical or new VMS exploration results are reported in this release. Only collar locations on figures accompanying this release are reported. ***Rock Chip Samples*** 1. Rock chip samples were selectively collected in the field and were dry when collected. 2. At the laboratory, sub-samples are produced with either a riffle or rotary splitter depending on the mass of the primary sample and according to internal laboratory procedures. 3. The laboratory sample preparation undertaken by Intertek-Genalysis follows industry best practice for ISO-accredited facilities and is considered appropriate for the sample matrix type and analysis method. At the laboratory, samples are dried, crushed and pulverised to 85% passing -75µm. 4. Rock chip samples are sometimes taken as composites from up to 1m from the site coordinate and recovered by geo-pick. 5. The sample preparation is considered appropriate for the type of sample. 6. No certified reference material (CRM) or blank QAQC samples were inserted with the sample batches as it typically included less than 25 primary samples. No field duplicates were taken.

Criteria	Commentary
	7. At the laboratory, Intertek-Genalysis performed its own internal checks including insertion of pulp duplicates, CRM and repeat samples as required. 8. Rock chip samples were selectively collected from in-situ outcrops. Sampling was done to identified potential elemental anomalism associated with VMS mineralising systems. 9. No field duplicates of rock chip samples were taken. 10. Rock chip sample sizes are appropriate to the grain size of the material being sampled. Samples were fine to medium grained rock material and samples weighed 500g to 1.5 kg. 11. Sample mass is recorded by the laboratory and reported to the company for incorporation into the database.
Quality of assay data and laboratory tests	1. No duplicates were collected for diamond holes. Duplicates in RC were collected by splitting a second sample from the cyclone during drilling of a given meter, at a rate of 2:100. 2. Sample sizes are considered appropriate to give an indication of mineralisation given the expected particle size. 3. All samples are sent to Intertek at their Perth facility for sample preparation and assaying. Samples were dried, and the whole sample pulverised to 85% passing 75 µm, and a sub-sample of approx. 200 g retained. A nominal 25 g was used for the Fire Assay analysis. 4. QA/QC protocols include the submission of blanks and standards (commercial certified reference materials used). The frequency rate for each QA/QC sample type is 4 Standards and 4 Blanks per 100 samples. No duplicates are collected. 5. Aeris QAQC protocols have been met, with no assay bias or precision problems observed from the assay data. 6. Select intervals corresponding to a full sample length of RC and DD samples were analysed by the 4A/MS48 method for a full 48 multi - element suite which comprises the following elements: ***VMS Exploration*** 1. No historical or new VMS exploration results are reported in this release. Only collar locations on figures accompanying this release are reported. Rock Chip Samples 1. Laboratory assaying for the rock chip samples was undertaken by Intertek-Genalysis, an ISO 9001 certified laboratory. The Four

Criteria	Commentary

Acid digest method is also considered a near total digest of almost all minerals species including base metal.

2. The nature and quality of the procedures and assaying techniques at the laboratory are considered appropriate for the rock type and style of mineralisation.
3. The Intertek-Genalysis 4A/MS48 method for a 48 multi - element suite was used.
4. Rock chips were analysed by the 4A/MS48 method for a full 48 multi -element suite which comprises the following elements:

Element	Range ppm			Element	Range ppm			Element	Range ppm		
Ag	0.05	-	500	Hf	0.05	-	2000	Sb	0.05	-	1%
Al	50	-	15%	In	0.01	-	2000	Sc	0.1	-	5000

5. For rock chip samples no geophysical, spectrometer or handheld pXRF instruments have been used to determine any element concentrations reported here.
6. Handheld pXRF instrument is only used to identify potential elemental anomalism and is not considered for target definition, only results from samples analysed by the 4A/MS48 method are considered.
7. The laboratory (Intertek-Genalysis) performed internal QAQC checks including insertion of commercially produced CRMs and Control Blanks as required.
8. The Competent Person is satisfied that the quality of assay data and laboratory tests are appropriate to the mineralisation under investigation.

Geophysics

1. **GPS Survey and Gravity Datum** – Horizontal Datum: Geocentric Datum of Australia 1994 (GDA94) Map Grid of Australia 1994 (MGA94) Zone 51. Datum number 201409000001.
2. **Survey Controls** - One Leica GX1230 GNSS receiver was utilised as primary control for the survey, coincident with the gravity datum 201409000001 location. Raw static GNSS data was logged at 5 second intervals during acquisition at GNSS bases. An additional GNSS receiver was place nearby using the same logging rate as redundancy in case of primary GNSS receiver failure. Coordinates for GNSS base stations have been calculated using three days' worth of static GNSS data connected to Australian based IGS (International GNSS Service, formerly the International GPS Service). These resulting base positions usually show final accuracy standard deviations (SD) of better than 5mm obtained for x, y and z, and can be considered first order.
3. **Gravity Controls -** For the gravity survey control was established on the Australian Datum number 201409000001, where the observed gravity values were stacked over 120 seconds to ensure accuracy, until repeated readings repeated to 0.01 mGal of a dial reading or less.
4. **Gravity Observations -** Gravity measurements were conducted

Criteria	Commentary
	using Scintrex CG - 5 Autograv instruments. Readings of 120 seconds were taken at the base station. Two 20 seconds readings were taken at all other gravity survey points. Base station readings were taken at the beginning of the day and at the end of the day's fieldwork. All Autograv instruments apply an instrument drift correction to its final gravity reading. Any residual drifts between base station readings are corrected by the gravity post processing software. The instruments also apply Earth Tide Corrections to their final gravity reading at each station. 5. **Gravity Processing -** The gravity values for the survey are related to the Australian National Datum 201409000001. Note that all gravity values are expressed in units of milligals. Geosoft GRAVRED software was used to perform gravity reductions to produce a set of observed gravity values that can be used for gridding, imaging, and further analysis. The recorded Scintrex raw gravity data is corrected for instrument scale factor, instrument drift, earth tide, observed gravity, free air, terrain, atmospheric, and bouguer, using the Geosoft's GRAVRED software.
Verification of sampling and assaying	1. Significant results are checked by the Exploration superintendent (or delegate) and General Manager Geology. Additional checks are completed by the Database Geologist. QAQC reports are completed on each batch of assays received from the laboratory. 2. All drill hole data is stored in an Acquire database system and maintained by the Company. 3. All drill hole logging is carried out on laptop computers using industry-standard geological logging applications. Logging data is synchronised electronically to the AcQuire Database. Assay files are received electronically from the Laboratory and imported into the Company's Acquire database. 4. Upon receipt of the assay data no adjustments are made to the stored assay values. ***VMS Exploration*** 1. No historical or new VMS exploration results are reported in this release. Only collar locations on figures accompanying this release are reported. ***Rock Chip Samples*** 1. The assay results have been checked by Jaguar Mine site geologists. 2. The rock sample data is entered onto pre-defined Microsoft (MS) Excel log sheets following the Company's documented internal geological protocols and procedures manual and backed up with logs stored in the company database hosted on a server in the Brisbane office. 3. The laboratory data is provided electronically to the Company and is validated and imported into the Master Database. Data is supplied by the laboratory as Excel CSV and S01 files and PDF certificates signed by the relevant laboratory manager. 4. No adjustments or calibrations were made by Aeris to any laboratory assay data for samples collected by Aeris.

Criteria	Commentary
	Geophysics 1. Raw data was processed and validated daily. 2. Base station readings were taken at the beginning of the day and at the end of the day's fieldwork for comparison
Location of data points	1. Drill hole locations were set out for drilling by handheld GPS, with an accuracy of 5 m in Northing and Easting. 2. For angled drill holes the drill rig mast is set up using a clinometer with verification of azimuth and dip using either a Reflex azi aligner or north seeking gyro. 3. The drill contractor used a true north seeking gyroscope for downhole surveying. Downhole surveys were collected at variable intervals while drilling and an end of hole survey with a nominal 10 m interval spacing between points. 4. Grid projection is GDA94, MGA Zone 51. 5. RL's are allocated to the drill hole collars using detailed DTM's generated during aeromagnetic and ground gravity survey data. The accuracy of the DTM is estimated to be better than 1 to 2 m in elevation. ***VMS Exploration*** 1. Historical VMS AC collar positions have not been field validated, given the age of the programs and lack of collar preservation. Collar coordinates were stored in either MGA81 or AGD84 2. Historical VMS RC and diamond drill hole collar positions away from VMS deposits have been pickup using handheld GPS; GDA94, MGA Zone 51, and with DGPS (Differential Global Positioning System) if located within the footprint of the VMS Deposits. 3. Historical or new VMS exploration results are reported in this release. ***Rock Chip Samples*** 1. The location of rock chip samples has been recorded using a handheld 12-channel Garmin GPS-Map unit with an accuracy of ±3 m. This method is considered appropriate for this phase of exploration sampling. 2. All coordinate data is reported using the grid system MGA94 Zone 51 South. The data is projected to Universal Transverse Mercator (UTM) coordinate system. 3. The Jaguar Mine site digital terrane model (DTM) is being as a topographic control. ***Geophysics*** 1. **GPS Survey and Gravity Datum** - Horizontal Datum: Geocentric Datum of Australia 1994 (GDA94) Map Grid of Australia 1994 (MGA94) Zone 51. Datum number 201409000001. 2. **Survey Control** - Coordinates for GNSS base stations were calculated using three days' worth of static GNSS data connected to Australian based IGS (International GNSS Service, formerly the International GPS Service) stations using Geoscience Australia's online GNSS processing system, AUSPOS. These resulting base positions usually show final accuracy standard deviations (SD) of better than 5mm obtained for x, y and z, and can be considered

Criteria	Commentary
	first order.
Data spacing and distribution	***Reverse Circulation (RC)*** 1. The two RC holes are spaced approximately 175m apart, across a targeted structure. 2. Drill hole locations were designed to demonstrate the presence of a potential gold mineralising system in fresh rock at the Heather Bore Prospect. ***VMS Exploration*** 1. Historical drill holes targeting VMS mineral systems have no specific spacing throughout the property. Spacing is dependent on target characteristics. ***Rock Chip Samples*** 1. Data spacing of rock chip sampling was selective and dependent upon the location and extent of outcrop. 2. Rock chip samples are not used to inform Mineral Resource models. 3. Rock chip sampling was selective over gravity anomalies with the objective to identify VMS pathfinders over each high priority gravity anomaly. ***Geophysics*** 1. The infill gravity survey data set consists of 35,764 gravity stations collected on a nominal 50 metres spacing separated by 50, 100m and 200m spaced east west trending Lines. 2. The infill gravity survey spacing is considered adequate for project generation and drill targeting.
Orientation of data in relation to geological structure	1. The orientation of the drill holes is approximately perpendicular to the local strike (340° degrees azimuth) and dip (-70° west) of the targeted structure. 2. A sampling bias has not been introduced. 3. Bedrock drill testing is considered to have been approximately perpendicular to strike and dip of mineralisation. ***VMS Exploration*** 1. No historical or new VMS exploration results are reported in this release. Only collar locations on figures accompanying this release are reported. ***Geophysics*** 1. The survey lines were planned to maximise coverage across-strike of a known major structures being NS to NNW trending.
Sample security	1. Unique, pre-numbered calico sample bags corresponding to individual samples were collected in a bulker-bag, sealed, and transported to Intertek in Perth via a transport contractor. ***VMS Exploration***

Criteria	Commentary
	1. No historical or new VMS exploration results are reported in this release. Only collar locations on figures accompanying this release are reported. ***Rock Chip Samples*** 1. Pre-numbered calico sample bags were collected in a bulka bag, sealed, and transported to Intertek in Perth via a transport contractor.
Audits or reviews	1. Sampling and assaying techniques are considered industry standard. Internal reporting of QAQC results is completed quarterly. ***Historic datasets*** 1. Aeris understands that IGO and Round Oak maintained the database regarding historical drilling data prior to Aeris taking ownership of the Jaguar project in 2022. The database is maintained to industry standards. 2. No known formal audit has been conducted. ***Rock Chip Samples*** 1. Aeris has not undertaken external audits of surface rock sampling techniques or data. Internal Company reviews of sampling techniques and data by the Aeris geologists confirm that sampling has been conducted to industry standards. ***Geophysics*** 1. The gravity data was reviewed and processed by an independent consultant from Southern Geoscience Consultants.

APPENDIX F

JORC Code, 2012 Edition – Table 1

Section 2: Reporting of Exploration Results

The information presented supports the following activities: 1) Holey Moley 2025 RC drill program, 2) gravity survey and 3) rock chip sampling

Criteria	Commentary
Mineral tenement and land tenure status	1. The Jaguar Operation tenement package is 60 km north of Leonora in Western Australia. The Jaguar Operations tenure comprises 39 licences covering an area of approximately 400.95 km^2. 2. Round Oak Pty Ltd, a wholly owned subsidiary of Aeris Resources Limited, holds the Jaquar Operation tenement package. 3. The planned drill program reported in this announcement is located within tenement E37/01162. This tenement is in good standing, with no known impediments.
Exploration done by other parties	1. Several identities, including Chevron, Normandy, Newmont, IGO, and Round Oak, carried out multiple exploration campaigns at the Holey Moley gold prospect between 1987 and 2019. These campaigns consisted mainly of AC drilling, completed on ± 100m

Criteria	Commentary
	line spacing and limited to a depth ± 100m. The results from the AC programs highlight a significant (0.2 g/t) gold anomaly in weathered rock that extends over 2km of strike. ***VMS Exploration*** 1. The Jaguar Mine site has an established exploration history with base metal activity dating back to the early 1970s and followed by four VMS discoveries (Teutonic Bore, 1975; Jaguar, 2002; Bentley, 2008, and Triumph, 2015). Since the 1970s to the present, exploration has been focused mainly on base metals. Base metal exploration has been mainly carried out by the following companies: • Australian Selections - 1970's • Seltrust Mining Corp - 1976 • Pilbara Mines Ltd - 1977 • BP Minerals 1980 -1985 • Pilbara Mines - 1997 • Pilbara/Inmet Mining Corp JV – 2001 • Jabiru – 2004 • Independence Group (IGO) – 2011 • Round Oak Mineral – 2018 • Aeris Resources – 2022 2. Other early VMS work also included aeromagnetic surveys and interpretation.
Geology	***Gold Exploration*** 1. The Holey Moley gold prospect lies within Archaean rocks of the Gindalbie domain of the Yilgarn craton. The metamorphic grade is generally within the prehnite-pumpellyite range but can locally increase to lower-greenstone facies. 2. Geology surrounding Heather Bore is consistent with a regional north-northwest strike with a westward dipping succession of basaltic to andesitic volcanics, lava intercalated with mafic to dacitic volcaniclastics and narrow black shale units. Late dolerite sills inflating the stratigraphy are also present. 3. The Holey Moley gold prospect is considered prospective for shear-hosted orogenic style gold mineralisation along rheological contacts between mafic volcanics and felsic to intermediate volcaniclastic units. 4. Historical drilling suggests gold mineralisation could be associated with quartz–sericite–pyrite altered felsic to intermediate volcaniclastics adjacent to magnetite-chlorite altered mafic volcanics. ***VMS Exploration*** 1. The Teutonic Bore VMS (volcanogenic massive sulphide) deposits, located near Leonora, are situated within the Kurnalpi Terrane of the Yilgarn Craton. These deposits are hosted by a NW trending west facing volcanic complex consisting of calc-alkaline to transitional mafic and highly fractionated felsic volcanic rocks,

Criteria	Commentary
	including pillowed andesite and basalts, and rhyolite to dacite volcanoclastic units. The deposits are characterised by massive sulphide lenses, often with underlying stringer mineralisation, and are found within the Teutonic Bore Mafic package (Jaguar and Teutonic Bore deposits) or near the base of this mafic volcanic succession within rhyolite volcaniclastic (Triumph and Bentley Deposits). 2. Jaguar VMS deposits are known as VMS replacement-style deposits formed by hydrothermal alteration and replacement of pre-existing highly permeable volcaniclastics and sedimentary rocks. 3. Since the 1970s to 2022, VMS exploration at Jaguar focused along the mafic–felsic volcanic contact. 4. Data review and field work completed by Aeris geologists, since acquisition of the Jaguar Mine Site in July 2022, has shown that the footwall rhyolite at the base of the mafic sequence is part of a thick (500m to 1.2 km) rhyolite volcaniclastic package, where the upper volcaniclastic unit of this sequence host several gravity anomalies of interest to Aeris. This upper rhyolite volcaniclastic unit, which has seen very little VMS exploration work, is considered to be highly prospective for VMS Exploration.
Drill hole information	1. All relevant information pertaining to drilling, surface rock sampling and geophysical surveying referenced in the main body of the report has been provided.
Data aggregation methods	1. Drill intervals for RC drill programs are monitored at the drill rig during drilling by an Aeris geologist. 2. Where an interval involves multiple samples of varying length, a length-weighted average is applied. 3. Reported significant Au intervals are based on a minimum width of 1m, minimum Au grade 0.1g/t Au and a maximum of 2m of below cut-off material (Internal dilution does not exceed 2m of consecutive samples below 0.1g/t Au). 4. No metal equivalent values are used. 5. Where historic data is used, values may be scaled from original reported values by relevant orders of magnitude to standardise values for interpretation (e.g., 1000ppb/ppm). Original values are stored in their original state/units and a new column is computed per sample. 6. Metal anomalism isopaches are interpreted by hand to define target areas. No kriging or other similar methods were employed. Isopach's are drawn from max downhole value, per relevant element per hole. ***Rock Chip Samples*** 1. No averaging, grade truncations, aggregations or cut-offs have been made for rock sample assays.
Relationship between mineralisation widths and intercept lengths	1. No relationships are being drawn between potential mineralisation widths and intercept lengths. Assay results are pending for both drill holes. ***Rock Chip Samples*** 1. Rock chip samples were collected selectively along an interpreted

Criteria	Commentary
	strike of favourable stratigraphy for VMS mineralisation based on in-house geological work and locations of the known VMS deposits within the Jaguar Mine Site.
Diagrams	1. Relevant diagrams are included in the main body of this report.
Balanced reporting	1. The reporting is considered balanced, and all material information associated with the drill results has been disclosed.
Other substantive exploration data	1. There is no other relevant substantive exploration data to report. 2. All historical drill hole data and significant gold intercepts for the Holey Moley prospect have been reported previously. Refer to ASX announcement "Exploration and resource drilling update" dated 17 June 2024. All material information relating to the 2025 RC drill program at Holey Moley is included within this report.
Further work	1. At the Holey Moley gold prospect, exploration activities will continue to evaluate the potential for a significant gold deposit. Further RC drilling will be planned based on the current results. 2. VMS exploration will focus on drill testing eight priority targets in FY26.
