Aurum's Managing Director Dr. Caigen Wang said: *"It is my pleasure to announce further high-grade gold intercepts at the Boundiali project. This time at BDT1 where our drills hit* ***6m @ 30.68 g/t Au*** *from 410m inc.* ***4m @ 45.91 g/t Au*** *inc.* ***1m @ 181.20 g/t Au.*** *This great result confirms extensions to north plunging high-grade shoots at BDT1 and these remain open.*

Aurum is on track to complete 100,000m of diamond drilling at Boundiali in 2025. These new drill results from multiple deposits will be incorporated into our first MRE update, which we plan to release imminently, and build upon the current ***1.59Moz*** *Boundiali MRE. A second update, planned for late in CY25, will incorporate results from planned drilling at the* ***BD****,* ***BM****, and* ***BST*** *deposits, as well as numerous untested gold-in-soil anomalies.*

Aurum's use of its own drill rigs, with our fleet of 10 rigs, provides for cost-effective and accelerated exploration, underpinning our objective of significant resource growth at Boundiali in 2025 and beyond, ultimately contributing to a Pre-Feasibility Study expected by year-end.

A 30,000m diamond drilling program is underway at the Napié project, targeting expansion of the current ***0.87Moz MRE****, with an updated MRE anticipated by year-end.*

With a combined ***2.5Moz of gold*** *across Boundiali and Napié, and substantial drilling programs now in play for both projects, Aurum is well-positioned for significant resource growth and further value creation in 2025."*

The **BDT1, BDT2** gold deposits, and **BDT3** gold prospect lie within an underexplored **13km by 3km mineralised corridor**. Gold mineralisation is hosted in a thick, north-south trending sandstone unit, positioned between hanging wall and footwall volcano-sedimentary rocks. The gold which is free milling[8] is associated with fine disseminated pyrite and an alteration assemblage of hematite, silica, chlorite, tourmaline, quartz veinlets, albite, and carbonate.

Drilling is ongoing at **BDT1, BDT2** and **BDT3** with more assays pending. True widths for these shallow, wide gold intercepts are estimated at about 65% - 80% of reported downhole lengths.

Details of drill collar location and assay results for the new drilling at **BDT1, BDT2** and **BDT3** is provided in Table 1 and respectively. Plans showing location of the Boundiali Gold Project and the assay results are presented in the following figures, general locations in Figure 1 and Figure 2, project details in Figure 3, and plans showing assay results in Figure 4 (**BDT1)**, Figure 6 (**BDT2)**, Figure 8 (**BDT3**), and example cross sections in Figure 5 (**BDT1**), Figure 7 (**BDT2**), and Figure 9 (**BDT3**).

Gold mineralisation remains open along strike and at depth on all deposits and prospects at the Boundiali Gold Project. With Aurum's 100,000m drilling program ongoing in CY 2025, further work is planned to follow up these encouraging results.

- **1.00m @ 4.82 g/t Au** from 222.00m (BSDD0007)
- **1.00m @ 2.56 g/t Au** from 121.00m (BSDD0009)
- **1.50m @ 3.27 g/t Au** from 0m (BSDD0011)
- **6.00m @ 0.70 g/t Au** from 174.00m inc. **1.00m @ 2.53 g/t Au** (BSDD0012)

These new results are in addition to previous exploration drilling at **BST1** has returned impressive results[11]:

- **20m @ 10.45g/t Au** from 38m (BRC0004S BIS)
- **30m @ 8.30g/t Au** from 39m (NDC007)
- **28m @ 4.04g/t Au** from 3m and **6m @ 3.29g/t Au** from 47m (BRC003)
- **9m @ 7.90g/t Au** from 99m (BRC006)
- **27m @ 2.42g/t Au** from 27m (BRC175)
- **20m @ 1.29g/t Au** from 211m (NDC016)
- **2m @ 13.57g/t Au** from 130m (NDC017).

The **BST1** gold deposit, located 19km to the south of **BDT1** on the Nyangboue shear zone, is hosted in a sedimentary package comprising alternating sandstones and shales with minor intraformational conglomerates. Broad zones of lower grade disseminated mineralisation envelope higher grade zones which are in some instances associated with quartz veining with visible gold. Gold mineralisation encountered occurs as discrete higher-grade zones within a broad low-grade envelope within a folded sedimentary package. Extensive sulphide and carbonate alteration occurs with higher grade zones being associated with structurally controlled zones of quartz veining. Oxidation extends to approximately 50m vertical depth and being a sedimentary protolith is soft and friable.

Sampling Techniques and Data

Criteria	JORC Code explanation	Commentary
Sampling techniques	• *Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.* • *Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.* • *Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.*	• *Samples were collected using diamond drilling techniques generally angled at 50° towards north-northwest to optimally intersect the mineralised zones.* • *Diamond core was logged both for geological and mineralised structures as noted above. The core was then cut in half using a diamond brick cutting saw on 1m intervals. Typically the core was sampled to geological intervals as defined by the geologist within the even two metre sample intervals utilised. The right-hand side of the core was always submitted for analysis with the left side being stored in trays on site.* • *Sampling and QAQC procedures were carried out to industry standards.* • *Sample preparation and assay was completed by independent international accredited laboratory MSALABS. Following cutting or splitting, the samples were bagged by the Client employees and then sent to the laboratory for preparation. These samples were subsequently sent to MSALABS at Yamoussoukro for analysis via 500g Photon Assay.*
• ***Drilling techniques***	• *Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).*	• *Diamond drilling carried out with mostly NTW and some HQ sized equipment. PQ-size rods and casing were used at the top the holes to stabilise the collars although no samples were taken from the PQ size core.*
• ***Drill sample recovery***	• *Method of recording and assessing core and chip sample recoveries and results assessed.* • *Measures taken to maximise sample recovery and ensure representative nature of the samples.* • *Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.*	• *Diamond drilling core recoveries ranged between 85% and 100% for all holes with no significant issues noted.*
• ***Logging***	• *Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining*	• *All holes were field logged by company geologists. Lithological, alteration and mineralogical nomenclature of the deposit as well as sulphide content were recorded.*

Criteria	JORC Code explanation	Commentary
	studies and metallurgical studies. • *Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.* • *The total length and percentage of the relevant intersections logged.*	*Metallurgical, Geotechnical and structural data has been recorded* • *Photography and recovery measurements were carried out by assistants under a geologist's supervision.* • *All drill holes were logged in full.* • *Logging was qualitative and quantitative in nature.*
• ***Sub-sampling techniques and sample preparation***	• *If core, whether cut or sawn and whether quarter, half or all core taken.* • *If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.* • *For all sample types, the nature, quality and appropriateness of the sample preparation technique.* • *Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.* • *Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling.* • *Whether sample sizes are appropriate to the grain size of the material being sampled.*	• *NTW core cut in half using a core saw. Typically, the core was sampled to major geological intervals as defined by the geologist within the even two metre sample intervals utilised. All samples were collected from the same side of the core.* • *Sample sizes are considered appropriate to correctly represent the moderately nuggetty gold mineralisation based on: the style of mineralisation, the thickness and consistency of the intersections, the sampling methodology and assay value ranges for Au.* • *The entire sample was crushed to 70% passing 2mm.* • *Crushed sample was split to produce 500g sample for analysis and the remaining reject kept for checks.* • *Field QC procedures involved the use of 2 types of certified reference materials (1 in 20) which is certified by Geostats Ltd,* • *Primary DD duplicate: Generated by cutting the remaining half core into a ¼ and sampled.* • *Coarse blank samples: Inserted 1 in every 20 samples* • *Laboratory Internal Duplicates and Standards* • *Sample sizes are considered appropriate to correctly represent the moderately nuggetty gold mineralisation based on: the style of mineralisation, the thickness and consistency of the intersections, the sampling methodology and assay value ranges for gold*
• ***Quality of assay data and laboratory tests***	• *The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.* • *For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and*	• *The analytical technique used is Chrysos™ PhotonAssay methodology. This uses a high-energy X-ray source that is used to irradiate large mineral samples, typically about 500g compared to the 50g of the fire assay. The X-rays induce short-lived changes in the structure of any gold nuclei present. As the excited gold nuclei return to*

	model, reading times, calibrations factors applied and their derivation, etc. • *Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.*	*their ground state, they emit a characteristic gamma-ray signature, the intensity of which is directly proportional to the concentration of gold. The penetrating nature of Chrysos™ PhotonAssay provides much higher energy than those used in conventional X-ray fluorescence (XRF), which provides a true bulk analysis of the entire sample. Samples are presented into a fully automatic process where samples are irradiated, measured, data collection and reporting.* • *No geophysical tools were used to determine any element concentrations used for this report.* • *Sample preparation checks for fineness were carried out by the laboratory as part of internal procedures to ensure the grind size was being attained. Laboratory QAQC includes the use of internal standards using certified reference material, and pulp replicates. No anomalous assays were noted in information provided to the Client.* • *The QAQC results confirm that acceptable levels of accuracy and precision have been established for the Classifications applied (exploration results only).*
• ***Verification of sampling and assaying***	• *The verification of significant intersections by either independent or alternative company personnel.* • *The use of twinned holes.* • *Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.* • *Discuss any adjustment to assay data.*	• *NA* • *No holes have been twinned* • *No adjustment to assay data* • *Logging records were mostly registered in physical format and were input into a digital format. The core photographs, collar coordinates and down the hole surveys were received in digital format.* • *Assay values that were below detection limit were adjusted to equal half of the detection limit value. Un-sampled intervals were assumed to have no mineralisation and they were therefore set to blank in the database, however these are minimal.*
• ***Location of data points***	• *Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.* • *Specification of the grid system used.* • *Quality and adequacy of topographic control.*	• *DD collar positions were initially located using a handheld GPS with a location error of +/3m.* • *The datum employed is WGS84, Zone 29* • *All drill hole locations are then surveyed utilising the differential GPS methods by both company and third party surveyors.* • *DGPS system utilised is typically within a 10 cm accuracy range which is suitable for the classification applied.*

Criteria	JORC Code explanation	Commentary
• ***Data spacing and distribution***	• *Data spacing for reporting of Exploration Results.* • *Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.* • *Whether sample compositing has been applied.*	• *Drillholes were completed on variable line spacings (from 100m to 50m) and orientations.* • *The drill hole spacing and distribution is considered sufficient to establish the degree of continuity appropriate for the Inferred Mineral Resource estimation procedures.* • *The samples were not composited prior to assay.*
• ***Orientation of data in relation to geological structure***	• *Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.* • *If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.*	• *Drill holes were drilled approximately at right angles to the anticipated strike of the target geochemical anomaly and orthogonal to the interpreted mineralisation orientation.*
• ***Sample security***	• *The measures taken to ensure sample security.*	• *Chain of custody is managed by the Client's senior site geologists and geotechnicians. Samples are stored in a core shed at site and samples were delivered to the laboratory by client geologists. Client employees have no further involvement in the preparation or analysis of the samples.*
• ***Audits or reviews***	• *The results of any audits or reviews of sampling techniques and data.*	• *Detailed reviews of sampling techniques were carried out on the site visit by RPM in October 2024 and follow up visit in March 2025.*

• ***Geology***	• *Deposit type, geological setting and style of mineralisation.*	• *The Boundiali Deposits are located within the Proterozoic Birimian rocks of the Man shield. It is situated on, 100km west of from the Korhogo in the northern part of the Côte d'Ivoire. They are located in the Bagoué- Syama shear zone within the sedimentary rock with minor associated intrusions of mafic dykes and late-stage granitoids. The various rock units trend NS to NNE similar to the regional metamorphic grade. The regional trend is NE to N.* • *The Boundiali deposits resemble typical shear zone deposits of the West African granite-greenstone terrane. The deposits themselves are associated with a major regional shear zone and are developed in a sandstone. Mineralisation may be spatially related to the emplacement of intrusives. The gold mineralisation is mesothermal in origin and occurs as free gold in quartz vein stockworks and zones of silicification, associated with pyrite and chalcopyrite. The gold mineralisation is found in linear zones with the contacts*

		showing evidence of shearing. Free gold is frequently observed. Alteration is weak to strong depending on the development of the system typically being sericite. • Two types of deformation are present in the drill cores: ductile deformation and brittle deformation. The gold mineralisation is related to deformed sandstone and graywacke, in shear zones, with sulphides (mainly pyrite and minor chalcopyrite) associated with visible gold. Alteration is characterized by chlorite, sericite, calcite, secondary quartz and disseminated pyrite. This assemblage is well developed in schistose, foliated rocks with presence of quartz veins or veinlets.
• **Drill hole information**	• A summary of all information material to the under-standing of the exploration results including a tabulation of the following information for all Material drill holes: • easting and northing of the drill hole collar • elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar • dip and azimuth of the hole • down hole length and interception depth • hole length • If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.	• Complete drill hole data has been provided. • Drill hole collar locations are shown in figures in main body of announcement.
• **Data aggregation methods**	• In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high grades) and cut-off grades are usually Material and should be stated. • Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low-grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail. • The assumptions used for any reporting of metal equivalent values should be clearly stated.	• Assay Intervals are shown in detail. Drilling intervals are predominantly 1m. • Metal equivalent values are not being reported.
• **Relationship between**	• These relationships are particularly important in the reporting of Exploration	• True widths have not been estimated as the geological controls on mineralisation

	Results. • If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported. • If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g. 'down hole length, true width not known').	in these initial drill holes into the prospect are not yet well understood. • The holes were drilled from east to west to test a steeply east dipping foliation in the limited rock exposures seen in the area. The mineralisation lies within what has been interpreted to be a ductile shear zone which would suggest that mineralisation should lie parallel to foliation.
• **Diagrams**	• Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include but not be limited to a plan view of drill hole collar locations and appropriate sectional views.	• Appropriate diagrams relevant to material results are shown in the body of this announcement.
• **Balanced Reporting**	• Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation. • Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.	• All drill hole and trench collar locations were surveyed utilising handheld GPS methods. Exploration results only being reported. • Drilling teams utilised the Reflex EZ-shot instrument to measure deviations in azimuth and inclination angles for all holes; however, vertical holes were not surveyed. The first measurement is taken at 6 m depth, and then at approximately every 30m depth interval and at the end of the hole. being reported
• **Other substantive exploration data**	• Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples - size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.	• All relevant exploration data is either reported in this announcement or has been reported previously by Aurum, Randgold or Predictive Discovery and is referred to in the announcement.
• **Further work**	• The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large- scale step-out drilling). • Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.	• The Company intends to continue exploration on the project and this work will include auger, aircore, RC and diamond core drilling, along with further geophysical surveys and geochemical sampling programs. • Diagrams included in body of report as deemed appropriate by competent person
