

## FINAL METALLURGICAL ASSAY RESULTS RETURN 110M AT 1.2% Li<sub>2</sub>O

### Highlights

- **Diamond drilling targeting Leia Pegmatite returned:**
  - 110.1m @ 1.2% Li<sub>2</sub>O from 195.0m (TAMT033) (est. true width) including;
    - 16.0m @ 1.8% Li<sub>2</sub>O from 266.0m
  - 81.0m @ 1.2% Li<sub>2</sub>O from 167.0m (TAMT034) (est. true width) including;
    - 56.0m @ 1.4% Li<sub>2</sub>O from 192.0m
  - 66.2m @ 1.2% Li<sub>2</sub>O from 180.8m (TAMT035) (est. true width) including;
    - 9.2m @ 2.6% Li<sub>2</sub>O from 180.8m and also including;
    - 19.3m @ 1.5% Li<sub>2</sub>O from 198m
- Results continue to highlight the exceptional thickness and grade throughout the Leia pegmatite
- Definitive Feasibility Study (DFS) metallurgy drilling now complete
- Cash at bank of \$55.1M at 30 June 2025

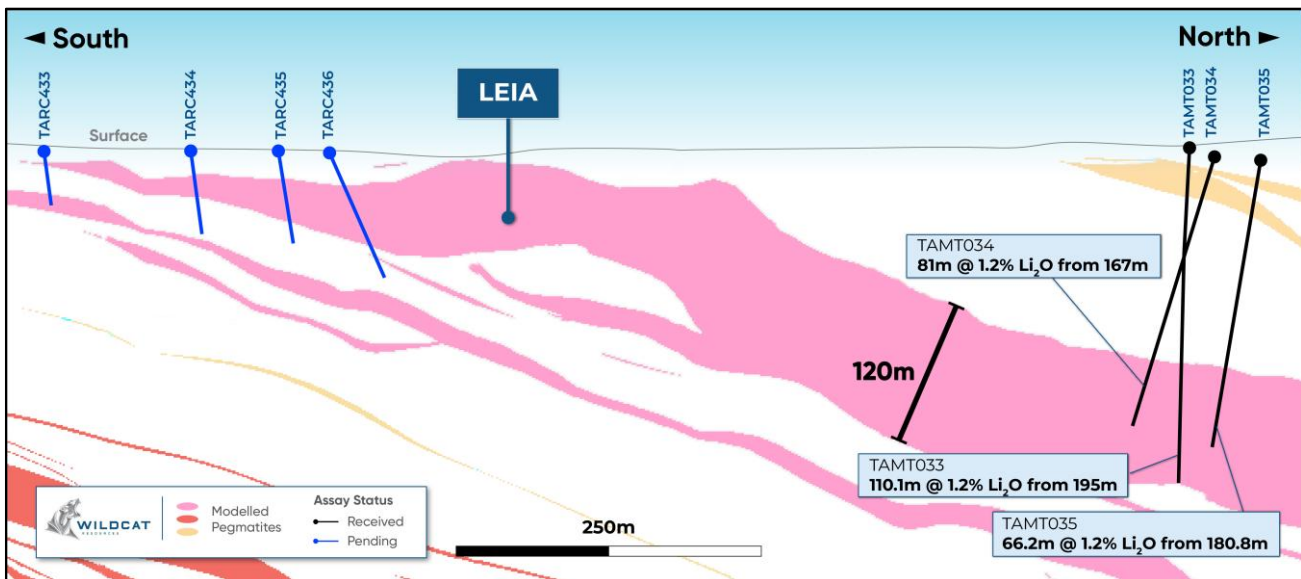

Figure 1: Longitudinal section of Leia, Luke and other pegmatites, showing the position of recently completed drilling (bold) as indicated by the section line on Figure 3.

**Wildcat's Geology Manager, Torrin Rowe, said:** "The latest metallurgical assay results continue to demonstrate the extraordinary thickness and consistent lithium mineralisation within the Leia Pegmatite. These intercepts indicate that localised areas within the pegmatite show overall uplift in both grade and width relative to the block model expectations and we hope to see this culminating in additional upside being realised".

**Australian lithium explorer and developer Wildcat Resources Limited (ASX: WC8) ("Wildcat" or the "Company")** is pleased to provide an update on metallurgical drilling at its Tabba Tabba Lithium-Tantalum Project, WA (**Figure 1, Figure 3 & Table 4**).

### Metallurgical Assay Results from Leia

The final three drillholes (Table 4) have been received from recent metallurgical drilling at the Leia Pegmatite, and drill samples confirm thick lithium mineralisation and an overall uplift in lithium grade relative to adjacent holes. Results from up-dip holes in the Leia pegmatite are still pending.

**TAMT033 returned 110.1m at 1.2% Li<sub>2</sub>O from 195.0m.** This represents an uplift of 21% relative to TARC234D, drilled just ~10m away (Table 1). Likewise, **TAMT035 reported 66.2m at 1.2% Li<sub>2</sub>O from 180.8m**, representing an uplift of 40% over the grade x width of TADD001 which was drilled approximately 35m away. While TAMT034 returned a minor downgrade of 13% relative to TARC144 drilled ~5m away, this could be attributed to a difference in sample medium (RC vs DDH) where minor variation would be expected. Given the overall uplift in expected grades and thickness, these results could potentially have a positive influence on future planning, estimation work and the definitive feasibility study ("DFS").

**Table 1: Comparison of new results vs their closest adjacent holes. New metallurgical drillholes are bold.**

Hole ID	MGA Easting (m)	MGA Northing (m)	RL (mASL)	Dip	Azimuth	Depth From (m)	Depth To (m)	Width (m)	Grade (Li <sub>2</sub> O%)	Grade x Width	Percentage Difference
TARC234D	700049	7713314	100	-67	282	210.5	301.9	91.4	1.2	109	<b>+21</b>

TARC144	699951	7713384	101	-55	270	170.0	258.0	88.0	1.2	109	<b>-13</b>
<b>TAMT034</b>	<b>699949</b>	<b>7713386</b>	<b>102</b>	<b>-60</b>	<b>264</b>	<b>167.0</b>	<b>248.0</b>	<b>81.0</b>	<b>1.2</b>	<b>95</b>	
TADD001	699923	7713434	99	-63	269	159.5	199.7	40.2	1.4	56	<b>+40</b>
<b>TAMT035</b>	<b>699931</b>	<b>7713436</b>	<b>100</b>	<b>-70</b>	<b>268</b>	<b>180.8</b>	<b>247.0</b>	<b>66.2</b>	<b>1.2</b>	<b>79</b>	

*Note: Grade x Width is a simplified measure of mineralization strength, calculated by multiplying the grade (Li<sub>2</sub>O%) by the width (thickness in meters) of the mineralized interval to enable simple comparison of mineralised intervals.*

### Next Steps at Tabba Tabba

- Progression of the Tabba Tabba Definitive Feasibility Study (DFS)
- Metallurgical sample selection and submission for commencement of DFS testwork
- Progress discovery strategy and continue regional exploration

This announcement has been authorised by the Board of Directors of the Company.

## About Tabba Tabba

The Tabba Tabba Lithium Project (Figure 2) is an advanced lithium and tantalum exploration and development project that is located on granted Mining Leases just 80km by road from Port Hedland, Western Australia. It is nearby some of the world's largest hard-rock lithium mines (47km by road from the 446Mt Pilgangoora Project<sup>1</sup> and 87km by road to the 259Mt Wodgina Project<sup>2</sup> ).

The Tabba Tabba Project was one of four significant LCT pegmatite projects in WA, previously owned by Sons of Gwalia. The others were Greenbushes, Pilgangoora and Wodgina which are now Tier-1 hard-rock lithium mines. Tabba Tabba is the last of these assets to be explored for lithium mineralisation.

The Tabba Tabba Project contains a maiden JORC (2012) Mineral Resource Estimate of 74.1Mt @ 1.0% Li<sub>2</sub>O (Table 2)<sup>3</sup>, which includes a maiden JORC (2012) Probable Ore Reserve estimate of 46.3Mt @ 0.99 Li<sub>2</sub>O (Table 3)<sup>4</sup>

The Ore Reserve estimate (Table 3) is based on the November 2024 MRE (Table 2), but does not include the Chewy, Han or Hutt pegmatites, which collectively account for approximately 15% of the MRE.

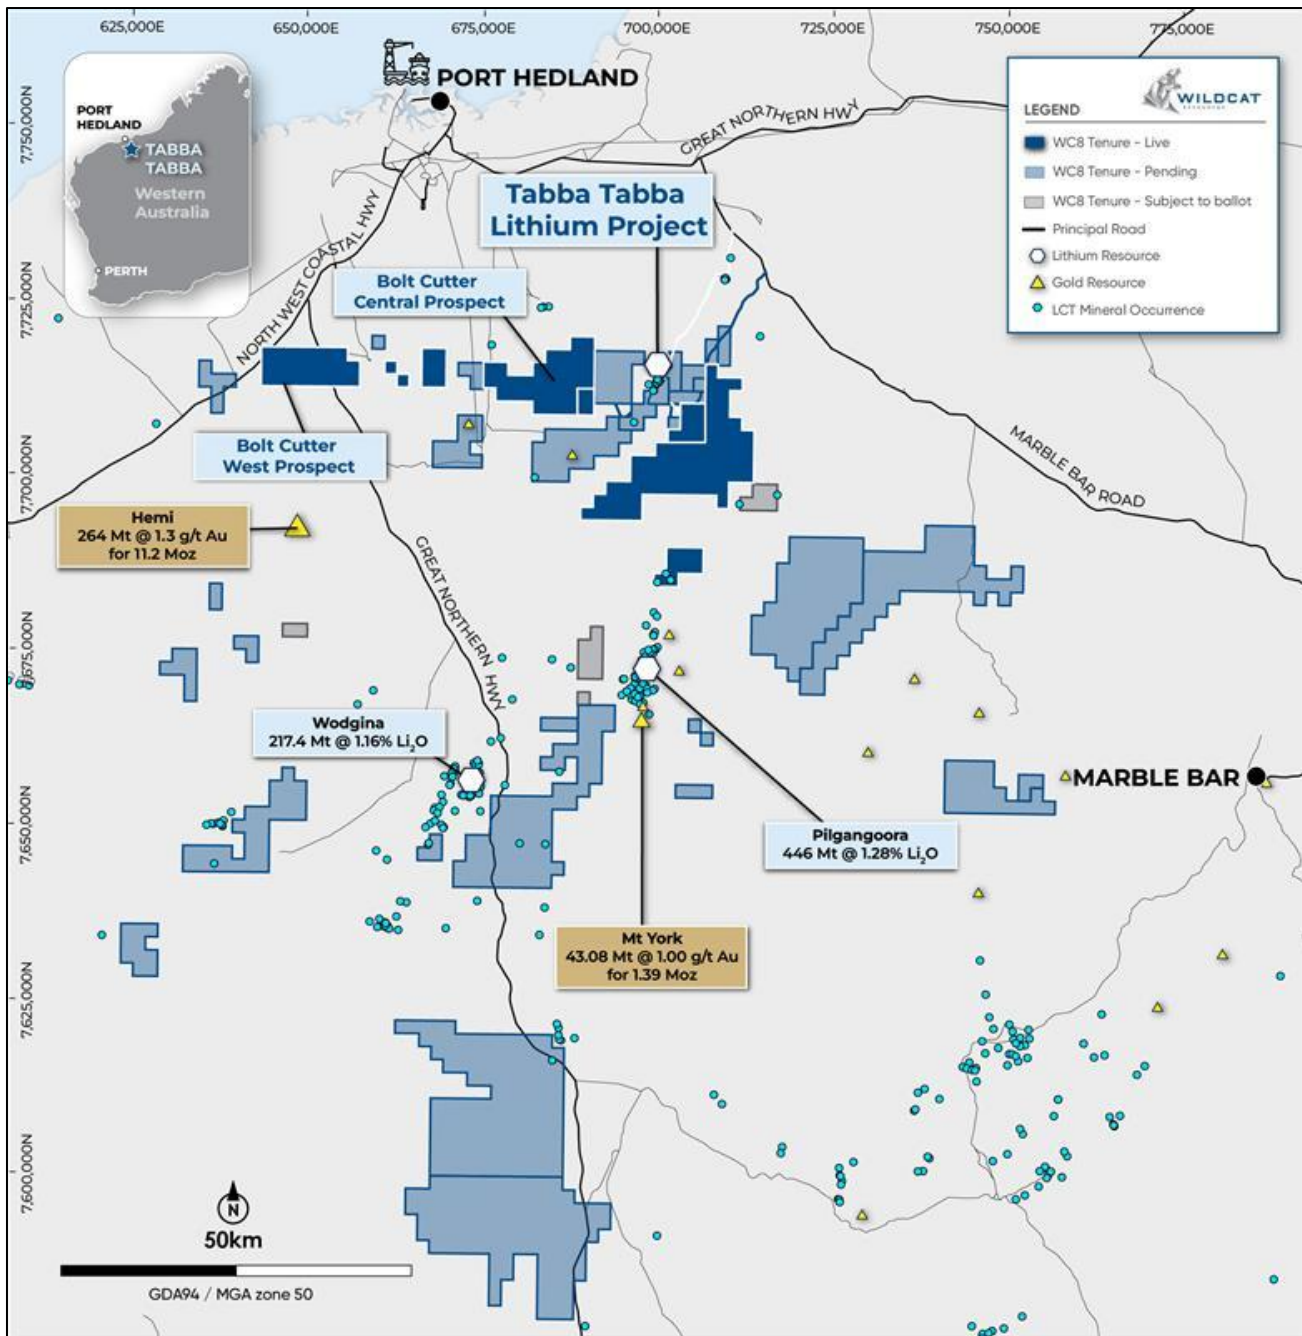

Figure 2: Location of the Tabbatabba Project.

The Leia pegmatite domain contains 63% of the lithium resource and some of the best intercepts from Leia previously announced include:

- 180.0m @ 1.1% Li<sub>2</sub>O from 206.0m (TARC148) (est. true width)
- 119.2m @ 1.0% Li<sub>2</sub>O from 334.3m (TADD010) (est. true width)
- 105.3m @ 1.1% Li<sub>2</sub>O from 213.7m (TARC259AD) (est. true width)
- 99.0m @ 1.2% Li<sub>2</sub>O from 207.0m (TARC234D) (est. true width)
- 94.0m @ 1.0% Li<sub>2</sub>O from 206.0m (TARC154AD) (est. true width)

- **67.0m @ 1.9% Li<sub>2</sub>O from 338.0m (TARC372D) (est. true width)**
- **85.0m at 1.5% Li<sub>2</sub>O from 133.0m (TARC128) (est. true width)**
- **85.0m at 1.3% Li<sub>2</sub>O from 167.0m (TARC144) (est. true width)**
- **84.0m @ 1.4% Li<sub>2</sub>O from 236.0m (TADD051) (est. true width)**
- **84.8m @ 1.3% Li<sub>2</sub>O from 251.4m (TADD020) (est. true width)**
- **89.8m @ 1.2% Li<sub>2</sub>O from 260.0m (TADD047) (est. true width)**
- **75.0m @ 1.1% Li<sub>2</sub>O from 155.0m (TADD022) (est. true width)**
- **73.0m at 1.1% Li<sub>2</sub>O from 266.0m (TARC246) (est. true width)**

The Luke Pegmatite is the second largest domain and contains 22% the Tabba Tabba lithium MRE. Some of the best intercepts from Luke previously announced include:

- **54.4m @ 1.2% Li<sub>2</sub>O from 267.9m (TADD030) (est. true width)**
  - **and 20.5m @ 1.5% Li<sub>2</sub>O from 297.5m**
  - **and 25.0m @ 1.2% Li<sub>2</sub>O from 363.9m**
- **61.0m @ 1.1% Li<sub>2</sub>O from 227.0m (TARC350D) (37.8m est. true width)**
  - **including 31.0m @ 1.6% Li<sub>2</sub>O from 228.0m (19.2m est. true width)**
- **50.0m @ 1.1% Li<sub>2</sub>O from 178.0m (TADD035) (est. true width)**
- **36.2m @ 1.6% Li<sub>2</sub>O from 200.8m (TARC341D) (29.0m est. true width)**
- **43.0m @ 1.4% Li<sub>2</sub>O from 316.0m (TARC348D) (est. true width)**
  - **including 23.0m @ 1.7% Li<sub>2</sub>O from 317.0m (est. true width)**
    - **and 43.4m @ 1.1% Li<sub>2</sub>O from 412.0m (est. true width)**
- **44.0m @ 1.1% Li<sub>2</sub>O from 189.0m (TARC353) (est. true width)**
  - **including 31.0m @ 1.5% Li<sub>2</sub>O from 189.0m**
- **26.6m @ 1.5% Li<sub>2</sub>O from 305.5m (TARC346D) (est. true width)**
  - **including 23.0m @ 1.7% Li<sub>2</sub>O from 317.0m**
- **22.3m @ 1.3% Li<sub>2</sub>O from 197.0m (TADD040) (est. true width)**
- **20.9m @ 1.1% Li<sub>2</sub>O from 268.1m (TARC373D) (est. true width)**
  - **and 45.0m @ 1.1% Li<sub>2</sub>O from 339.0m (est. true width)**

#### **Forward-Looking Statements**

*This document may include forward-looking statements. Forward-looking statements include, but are not limited to, statements concerning Wildcat Resources Limited's planned exploration programme and other statements that are not historical facts. When used in this document, the words such as "could," "plan," "estimate," "expect," "intend," "may", "potential," "should," and similar expressions are forward-looking statements. Although Wildcat Resources Limited believes that its expectations reflected in these forward-looking statements are reasonable, such statements involve risks and uncertainties, and no assurance can be given that actual results will be consistent with these forward-looking statements.*

**Competent Person's Statement**

*The information in this announcement that relates to Exploration Results for Tabbatabba Project is based on, and fairly represents, information compiled by Mr Torrin Rowe (Head of Geology and Exploration at Wildcat Resources Limited), a Competent Person who is a Member of the Australian Institute of Geoscientists (AIG). Mr Rowe is a fulltime employee and shareholder of Wildcat Resources Limited. Mr Rowe has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration, and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the Joint Ore Reserves Committee (JORC) Australasian Code for Reporting Exploration Results, Mineral Resources and Ore Reserves. Mr Rowe consents to the inclusion in this announcement of the matters based on his information in the form and context in which it appears.*

No New Information or Data: *This document contains exploration results, historic exploration results and Mineral Resource Estimates as originally reported in fuller context in Wildcat Resources Limited ASX Announcements - as published on the Company's website. Wildcat confirms that it is not aware of any new information or data that materially affects the exploration results, metallurgical results and Mineral Resource Estimates information included in the relevant market announcements. Wildcat confirms that the form and context in which the Competent Persons' findings are presented have not been materially modified from those market announcements.*

## Appendix 1

## Appendix 2

### JORC Code, 2012 Edition – Table 1

#### Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	Criteria	Commentary
Sampling techniques	<ul style="list-style-type: none"> <li>Nature and quality of sampling (e.g. cut channels, random chips, or specific specialized industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</li> <li>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</li> <li>Aspects of the determination of mineralisation that are Material to the Public Report.</li> <li>In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information.</li> </ul>	<ul style="list-style-type: none"> <li>Reverse circulation and diamond drilling completed by TopDrill Drilling.</li> <li>All RC drilling samples were collected as 1m composites, targeted 3-5kg sub-sample was collected for every 1m interval using a static cone splitter with the sub-sample placed into calico sample bags and the bulk reject placed in rows on the ground.</li> <li>Diamond core samples were collected in plastic core trays, sequence checked, metre marked and oriented using the base of core orientation line. It was then cut longitudinally down the core axis (parallel to the orientation line where possible) and half the core sampled into calico bags using a minimum interval of 30cm and a maximum interval of 1m.</li> <li>Pegmatite intervals were assessed visually for LCT mineralisation by the rig geologist assisted by tools such as ultraviolet light and LIBS analyser.</li> <li>All samples with pegmatite and adjacent wall rock samples were sent to ALS laboratories in Perth for chemical analysis.</li> <li>The entire 3kg sub-sample was pulverised in a chrome steel bowl which was split and an aliquot obtained for a 50gm charge assay.</li> <li>LCT mineralisation was assessed using the MS91-PKG package which uses sodium peroxide fusion followed by dissolution and analysis with ICP-AES and ICP-MS.</li> <li>Additional multielement analyses (48-element suite) using 4-Acid digest ICP-MS were requested at the rig geologist's discretion to aid geological interpretation.</li> </ul>
Drilling techniques	<ul style="list-style-type: none"> <li>Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).</li> </ul>	<ul style="list-style-type: none"> <li>Reverse circulation and diamond drilling with orientation surveys taken every 30m to 60m and an end of hole orientation using a Axis gyro tool. A continuous survey in and out of hole was completed at drillhole completion.</li> <li>Diamond drilling used HQ and NQ bits depending on ground conditions and hole depth.</li> </ul>
Drill sample recovery	<ul style="list-style-type: none"> <li>Method of recording and assessing core and chip sample recoveries and results assessed.</li> <li>Measures taken to maximise sample recovery and ensure representative nature of the samples.</li> </ul>	<ul style="list-style-type: none"> <li>RC sample recovery (poor/good) and moisture content (dry/wet) was recorded by the rig geologist in metre intervals based on visual estimation.</li> <li>The static cone splitter (Ox Engineering drill sampling system) on the RC rig was regularly checked by the rig geologist as part of QA/QC procedures.</li> <li>Sub-sample weights were measured and recorded by the laboratory.</li> </ul>

Criteria	Criteria	Commentary
	<ul style="list-style-type: none"> <li>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</li> </ul>	<ul style="list-style-type: none"> <li>No analysis of sample recovery versus grade has been made at this time.</li> <li>Diamond drilling is orientated, meter marked, RQD measured and density data is taken and samples are recorded based on geological parameters.</li> <li>Core recovery is calculated based on core block depths and physical measurements.</li> </ul>
Logging	<ul style="list-style-type: none"> <li>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</li> <li>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.</li> <li>The total length and percentage of the relevant intersections logged.</li> </ul>	<ul style="list-style-type: none"> <li>All RC samples were qualitatively logged by the rig geologist for lithology, alteration, mineralisation, structure, weathering and more. Data was then captured by Ocris and imported into a database.</li> <li>Pegmatite intervals were assessed visually for lithium mineralisation by the rig geologist assisted by tools such as ultraviolet light and a LIBS analyser.</li> <li>All chip trays were photographed in natural light and compiled using Sequent Ltd's Imago solution. UV photography studies are ongoing.</li> <li>All diamond core was qualitatively logged by a site geologist and the core trays were photographed</li> </ul>
Sub-sampling techniques and sample preparation	<ul style="list-style-type: none"> <li>If core, whether cut or sawn and whether quarter, half or all core taken.</li> <li>If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.</li> <li>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</li> <li>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</li> <li>Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling.</li> <li>Whether sample sizes are appropriate to the grain size of the material being sampled.</li> </ul>	<ul style="list-style-type: none"> <li>3kg to 5kg sub-samples of RC chips were collected from the rig-mounted static cone splitter into uniquely numbered calico bags for each 1m interval.</li> <li>Diamond core is drilled with HQ or NQ diameter and is cut longitudinally down the core axis (along the orientation line where possible) with an Almonte core saw and half core samples between 30cm and 1m in length are sampled and collected in numbered calico bags. Duplicates, blanks and standards inserted at the same rate as for the RC samples.</li> <li>Sample sizes are appropriate to the crystal size of the material being sampled with a targeted 85% passing 75 µm.</li> <li>Sub-sample preparation was by ALS laboratories using industry standard and appropriate preparation techniques for the assay methods in use.</li> <li>Internal laboratory standards were used, and certified OREAS standards and certified blank material were inserted into the sample stream at regular intervals by the rig geologist.</li> <li>Duplicates were obtained from using a duplicate outlet direct from the cyclone in the RC and a lab split in the DD at the site geologist's discretion in zones containing visual indications of mineralised pegmatite.</li> </ul>
Quality of assay data and laboratory tests	<ul style="list-style-type: none"> <li>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</li> <li>For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</li> </ul>	<ul style="list-style-type: none"> <li>The RC and diamond core cuttings were analysed with MS91-PKG at ALS using sodium peroxide fusion ICP-AES/MS for an LCT suite, fire assay for gold, and 4-acid digest ICP-AES and ICP-MS for multi-element analysis.</li> <li>Appropriate OREAS standards were inserted at regular intervals.</li> <li>Blanks were inserted at regular intervals during sampling.</li> <li>Certified reference material standards of varying lithium grades have been used at a rate not less than 1 per 25 samples.</li> </ul>

Criteria	Criteria	Commentary
	<ul style="list-style-type: none"> <li>Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.</li> </ul>	<ul style="list-style-type: none"> <li>Check sampling was completed at an umpire lab (Intertek) to validate results which demonstrated comparability.</li> </ul>
Verification of sampling and assaying	<ul style="list-style-type: none"> <li>The verification of significant intersections by either independent or alternative company personnel.</li> <li>The use of twinned holes.</li> <li>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</li> <li>Discuss any adjustment to assay data.</li> </ul>	<ul style="list-style-type: none"> <li>No independent verification of significant intersections has been made. Significant intersections were produced by an automated export from the database managers and checked by a Senior Geologist/Exploration Manager and the Geology Manager.</li> <li>Twinned holes of RC to DD have been drilled to allow correlation of assay results between drilling styles to provide more confidence in the model.</li> <li>Industry standard procedures guiding data collection, collation, verification, and storage were followed.</li> <li>No adjustment has been made to assay data as reported by the laboratory other than calculation of Li<sub>2</sub>O% from Li ppm using a 2.153 conversion factor.</li> </ul>
Location of data points	<ul style="list-style-type: none"> <li>Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</li> <li>Specification of the grid system used.</li> <li>Quality and adequacy of topographic control.</li> </ul>	<ul style="list-style-type: none"> <li>Location of drill holes were recorded by tablet GPS. Locational accuracy is +/-1m in the XY and +/-5m in the Z orientation.</li> <li>Survey priority is then replaced with a differential GPS (DGPS) on a campaign basis, initially by ABIMs contracting and then recollected by Wildcat with a private DGPS.</li> <li>All current data is in MGA94 (Zone 50).</li> <li>Topological control is via GPS and DEM calculated from a drone photographic survey. The LiDAR has generated a topographic surface accurate to &lt;20cm.</li> <li>Downhole survey's collected using the Axis Champion Gyro tool</li> </ul>
Data spacing and distribution	<ul style="list-style-type: none"> <li>Data spacing for reporting of Exploration Results.</li> <li>Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</li> <li>Whether sample compositing has been applied.</li> </ul>	<ul style="list-style-type: none"> <li>Drill hole spacing vary from twins to 200m apart with varying levels of infill.</li> <li>Exploration and resource drilling focussed on 50m and 100m spacings.</li> <li>There is abundant pegmatite outcrop and the drilling is spaced to determine continuity along strike and down dip. Infill drilling will also aim to close-off mineralisation along strike.</li> <li>No sample compositing has been applied.</li> </ul>
Orientation of data in relation to geological structure	<ul style="list-style-type: none"> <li>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</li> <li>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</li> </ul>	<ul style="list-style-type: none"> <li>No fabric orientation data has been obtained from the RC holes, although some holes have been logged with DH optical televiewer (OTV) and some structural data may be determined from this. Where OTV has been used on holes drilling from the northeast into Leia, the pegmatite has been intercepted at a perpendicular orientation to the hole axis, making the intercepts close to true width. These are also estimated against the geological model.</li> <li>All diamond holes are oriented with a base of hole orientation line and any relevant structures and fabrics are recorded qualitatively by the site geologist and recorded in the database. Most diamond holes have intercepted the pegmatite at close to perpendicular to the core axis, making the intervals close to true width and an estimation is provided when this is not the case.</li> </ul>

Criteria	Criteria	Commentary
		<ul style="list-style-type: none"> <li>• True width has been estimated from a 3D geological model built using Leapfrog software and holes are designed to intercept at true width.</li> <li>• True width has not been estimated for holes which have potentially drilled down-dip of pegmatite bodies as the geometry of the pegmatite intersections cannot currently be determined. These holes include TARC028, TARC085, and TARC088 in previous announcements.</li> <li>• True width has not been estimated for pegmatites of unknown geometry (early discoveries) and instead downhole widths are provided.</li> <li>• The drilling orientation and intersection angles are deemed appropriate.</li> </ul>
Sample security	<ul style="list-style-type: none"> <li>• The measures taken to ensure sample security.</li> </ul>	<ul style="list-style-type: none"> <li>• All samples were packaged into bulka bags and strapped securely to pallets and delivered by TopDrill to freight depots in Port Hedland. The samples were transported from Port Hedland to Perth ALS laboratories via Toll or Centurian freight contractors. Any umpire assays were transported as pulps or coarse rejects by ALS to Intertek (genalysis).</li> </ul>
Audits or reviews	<ul style="list-style-type: none"> <li>• The results of any audits or reviews of sampling techniques and data.</li> </ul>	<ul style="list-style-type: none"> <li>• Several internal audits have been completed by the Company's technical team as part of ongoing data validation. These include SQL queries, field validation, general data integration and photo analysis. No major errors have been identified.</li> </ul>

## Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	<ul style="list-style-type: none"> <li>Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.</li> <li>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</li> </ul>	<ul style="list-style-type: none"> <li>Wildcat Resources Limited Ltd owns 100% of the Tabba Tabba Project Mining Leases (M45/354; M45/375; M45/376 and M45/377)</li> <li>Royalties and material issues are set out in an agreement between Wildcat and GAM for Wildcat to acquire the Tabba Tabba Project as announced on 17<sup>th</sup> May 2023: <a href="https://www.investi.com.au/api/announcements/wc8/4788276b-630.pdf">https://www.investi.com.au/api/announcements/wc8/4788276b-630.pdf</a></li> <li>No known impediments.</li> </ul>
Exploration done by other parties	<ul style="list-style-type: none"> <li>Acknowledgment and appraisal of exploration by other parties.</li> </ul>	<ul style="list-style-type: none"> <li>Goldrim Mining Ltd and Pancontinental Mining Ltd ("PanCon") completed 24 OHP, 59 RC and 3 DD holes between 1984 and 1991.</li> <li>GAM drilling of 29 RC holes in 2013.</li> <li>Pilbara Minerals Ltd (PLS) completed 5 diamond holes in November 2013.</li> <li>Historic drilling targeted tantalum mineralisation. Drilling into the vast majority of the lithium resources has been completed by Wildcat since mid-2023.</li> </ul>
Geology	<ul style="list-style-type: none"> <li>Deposit type, geological setting and style of mineralisation.</li> </ul>	<ul style="list-style-type: none"> <li>The Tabba Tabba pegmatites are part of the later stages of intrusion of Archaean granitic batholiths into Archaean metagabbros and metavolcanics. Tantalum mineralisation occurs in zoned pegmatites that intruded a sheared Archaean metagabbro. The pegmatite contains in outcrop a symmetrically disposed outer cleavandite zone, mica zone and a megacrystic K feldspar zone with a centrally disposed quartz zone associated with an albitic replacement unit. The zones generally dip in sympathy with pegmatite margins. (Sourced from PanCon historical reports). Wildcat Resources has confirmed abundant spodumene occurs throughout the pegmatites. While studies are still underway, early XRD results (previously released) indicate that petalite mineralisation occurs more frequently in the northern The Hutt Pegmatite prospect.</li> </ul>
Drill hole information	<ul style="list-style-type: none"> <li>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: <ul style="list-style-type: none"> <li>easting and northing of the drill hole collar</li> <li>elevation or RL (Reduced Level - elevation above sea level in metres) of the drill hole collar</li> <li>dip and azimuth of the hole</li> <li>down hole length and interception depth</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li>Refer to tables in the report and notes attached thereto which provide all relevant details.</li> <li>Previous company announcements available here: <a href="https://www.asx.com.au/markets/trade-our-cash-market/announcements.wc8">https://www.asx.com.au/markets/trade-our-cash-market/announcements.wc8</a></li> </ul>

Criteria	JORC Code explanation	Commentary
	<ul style="list-style-type: none"> <li>- hole length.</li> <li>• If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</li> </ul>	
Data aggregation methods	<ul style="list-style-type: none"> <li>• In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high grades) and cut-off grades are usually Material and should be stated.</li> <li>• Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low-grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</li> <li>• The assumptions used for any reporting of metal equivalent values should be clearly stated.</li> </ul>	<ul style="list-style-type: none"> <li>• No top cut off has been used. Aggregated pegmatite intercepts calculated at a 0.1% Li<sub>2</sub>O cutoff grade with a maximum of 10m consecutive internal dilution and reporting overall intercepts with a weighted average grade &gt;0.5%. All smaller significant intercepts and the high-grade intervals included within broader aggregated intercepts have been separately reported and calculated using the most practical of a geologically interpreted subdomain or a 0.3% Li<sub>2</sub>O cut off and a maximum of 3m of internal dilution.</li> <li>• An iron cutoff of &gt;5% Fe has also been applied to each sample in order to exclude peripheral intervals that contain significant wall rock contamination or external intervals that are not pegmatite hosted Li<sub>2</sub>O intercepts. Smaller intervals of internal mafic &lt;10m are classified as waste and may still be included in intercept calculations. Minor discrepancies between pegmatite thickness and mineralised intercepts may arise due to mixed intervals of pegmatite and host rock, i.e. in RC drilling where a 1m interval may constitute mixed pegmatite and mafic wall rock. This may mean that the true boundary of the pegmatite may be slightly wider or smaller than what is reflected in the reported mineralized intercept.</li> <li>• No metal equivalents have been used.</li> </ul>
Relationship between mineralization widths and intercept lengths	<ul style="list-style-type: none"> <li>• These relationships are particularly important in the reporting of Exploration Results.</li> <li>• If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.</li> <li>• If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g. 'down hole length, true width not known').</li> </ul>	<ul style="list-style-type: none"> <li>• Most pegmatite intervals intercepted have returned assay results &gt;0.3% Li<sub>2</sub>O, some are mineralised in totality, others are partially mineralised with localised zones of lithium mineralisation below 0.3%Li<sub>2</sub>O. This is expected in fractionated, zoned pegmatite systems. Some zones have mineralisation that averages below 0.1% Li<sub>2</sub>O.</li> <li>• Holes are planned to intersect perpendicular to modelled mineralisation. Where surface conditions have not allowed optimal collar placement estimated true widths have been calculated and reported.</li> <li>• Cross sections illustrate the modelled pegmatite domains and intersections.</li> </ul>
Diagrams	<ul style="list-style-type: none"> <li>• Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</li> </ul>	<ul style="list-style-type: none"> <li>• See this announcement for appropriate maps and sections.</li> </ul>

Criteria	JORC Code explanation	Commentary
Balanced reporting	<ul style="list-style-type: none"> <li>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</li> </ul>	<ul style="list-style-type: none"> <li>Comprehensive reporting of all drill hole details have been previously reported in announcements since the acquisition by Wildcat in 2023.</li> <li>A summary of unannounced results for drillholes and their corresponding drillhole details has been included in this announcement (Appendix 1, Table 2&amp;).</li> </ul>
Other substantive exploration data	<ul style="list-style-type: none"> <li>Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples - size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</li> </ul>	<ul style="list-style-type: none"> <li>Everything meaningful and material is disclosed in the body of the report, has been previously announced or is ongoing/incomplete. Geological observations have been factored into the modelling and estimation work.</li> </ul>
Further work	<ul style="list-style-type: none"> <li>The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large-scale step-out drilling).</li> <li>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</li> </ul>	<ul style="list-style-type: none"> <li>Further drilling plans aim to extend the modelled pegmatites and increase the confidence of these zones (i.e. Inferred to Indicated and Indicated to Measured) and exploration drilling will target potential repeating pegmatites at depth.</li> <li>Further work will also include the finalisation of study work necessary to begin the development of the project.</li> </ul>
